Understanding Insertion and Return Loss with Tektronix S-Parameters

What are S-parameters?

S-parameters, or scattering parameters, are a set of complex numbers that characterize the performance of a passive two-port network. They provide information about the network's reflection and transmission characteristics.

What is insertion loss?

Insertion loss (IL) is a measure of the power loss that occurs when a signal passes through a network. It is expressed in decibels (dB) and is defined as the ratio of the input power to the output power.

What is return loss?

Return loss (RL) is a measure of the amount of power that is reflected back from a network towards the source. It is also expressed in decibels and is defined as the ratio of the reflected power to the incident power.

How are insertion and return loss related?

Insertion loss and return loss are inversely related. A high insertion loss typically indicates a low return loss, and vice versa. This is because a signal that is not reflected back (low return loss) will be transmitted through the network with minimal loss (low insertion loss).

How can Tektronix instruments help measure insertion and return loss?

Tektronix offers a range of network analyzers that can be used to measure S-parameters, including insertion loss and return loss. These instruments provide accurate and reliable measurements over a wide frequency range. By using Tektronix network analyzers, engineers can gain valuable insights into the performance of their passive circuits and systems.
