**How does a button accordion work?** The diatonic button accordion is bisonoric, meaning when a button is pressed, the note sounded changes depending on whether the bellows are being expanded or contracted. This is similar to the harmonica, where the note changes depending on whether the player is breathing in or out.

They play the same notes as the same buttons of the 1st and 2nd rows.

**What is the difference between a diatonic accordion and a button accordion?**

Diatonic accordions are designed to play music in a specific key and typically consist of 7 tones in a diatonic major or minor scale. **What does m mean in accordion music?** To indicate that the performer needs to play chords, there are several markings possible: the most common is to have an uppercase "M" over a note for a major chord, lowercase "m" for a minor chord, and lowercase "d" for a diminished chord. If there is no chord type given, major is the default.

**When not to use accordions?**

**What are the advantages of button accordion?** Comparing the layout to the piano accordion, the advantages of a chromatic button accordion are the greater range and better fingering options. On the other hand, some fingering positions require twisting of the wrist and the aspect of alternative fingering patterns may stunt one in sessions of difficult sight reading.
