You Are Here: Why We Can Find Our Way to the Moon but Get Lost in Malls

You've probably heard the joke that it's easier to find your way to the moon than it is to find your way out of a mall. While that may be an exaggeration, there's actually some truth to it. Despite the fact that we have sophisticated technology that allows us to navigate the vastness of space, many of us still struggle to find our way around even the most familiar of places.

So what's the difference between navigating space and navigating a mall?

According to environmental psychologist Colin Ellard, the answer lies in the way that our brains process information. When we're in a large, unfamiliar space, our brains try to make sense of it by creating a mental map. This map is based on landmarks, such as stores, restrooms, and exits. However, these landmarks are often not very distinctive and can be easily forgotten. As a result, we can easily get lost.

In contrast, when we're navigating space, we have a much better sense of where we are. This is because space is more structured and predictable. There are clear landmarks, such as the sun, moon, and stars, and we can use these landmarks to orient ourselves. Additionally, we can rely on our sense of gravity to help us stay on track.

So what can we do to improve our wayfinding skills in malls and other large spaces?

1. Pay attention to landmarks. As you're walking around, take note of the different stores, restrooms, and exits. Make a mental map of where these landmarks are located.
2. Use a map. If you're having trouble finding your way around, consult a map of the mall. This will give you a better overview of the layout and help you to plan your route.
3. Ask for help. If you're still lost, don't be afraid to ask a security guard or mall employee for directions. They'll be happy to help you find your way.
