Sterling Test Prep: SAT Physics Practice Questions and High-Yield Concepts

SAT Physics is a challenging section of the exam, but with the right preparation, you can achieve a high score. Sterling Test Prep offers comprehensive SAT Physics practice questions and detailed explanations to help you master the high-yield concepts tested on the exam.

Question 1: A ball is thrown vertically upward with an initial velocity of 20 m/s. What is the ball's maximum height? **Answer:** Use the equation $v^2 = u^2 + 2as$, where v is the final velocity (0 m/s at the maximum height), u is the initial velocity (20 m/s), a is the acceleration due to gravity (-9.8 m/s^2), and s is the displacement (the maximum height). Solving for s , we get:

$$\begin{aligned}s &= (v^2 - u^2) / 2a \\s &= (0 - 20^2) / (2 * -9.8) \\s &= 20.41 \text{ m}\end{aligned}$$

Question 2: A block of mass 5 kg is pushed along a frictionless surface with a force of 10 N. What is the acceleration of the block? **Answer:** Use Newton's second law, $F = ma$, where F is the net force (10 N), m is the mass (5 kg), and a is the acceleration. Solving for a , we get:

$$\begin{aligned}a &= F / m \\a &= 10 \text{ N} / 5 \text{ kg} \\a &= 2 \text{ m/s}^2\end{aligned}$$

Question 3: A light beam of wavelength 500 nm is incident on a double slit with slit separation of 0.1 mm. What is the distance between the bright fringes on a screen placed 1 m away from the slits? **Answer:** Use the equation $d = \lambda D / s$, where d is the distance between the bright fringes, λ is the wavelength (500 nm = $5 \times 10^{-7} \text{ m}$), D is the distance between the screen and the slits (1 m), and s is the slit separation (0.1 mm = $1 \times 10^{-4} \text{ m}$). Solving for d , we get:

$$\begin{aligned}d &= (5 \times 10^{-7} \text{ m}) * (1 \text{ m}) / (1 \times 10^{-4} \text{ m}) \\d &= 5 \times 10^{-3} \text{ m}\end{aligned}$$

Question 4: A capacitor with a capacitance of 10 μF is connected to a battery with a voltage of 12 V. What is the charge stored on the capacitor? **Answer:** Use the

equation $Q = CV$, where Q is the charge stored on the capacitor, C is the capacitance ($10 \mu\text{F} = 10 \times 10^{-6} \text{ F}$), and V is the voltage (12 V). Solving for Q , we get:

$$\begin{aligned} Q &= CV \\ Q &= (10 \times 10^{-6} \text{ F}) * (12 \text{ V}) \\ Q &= 120 \mu\text{C} \end{aligned}$$

Question 5: A circuit has a resistor of 10 ohms connected in series with a capacitor of $10 \mu\text{F}$. What is the time constant of the circuit? **Answer:** Use the equation $\tau = RC$, where τ is the time constant, R is the resistance (10 ohms), and C is the capacitance ($10 \mu\text{F} = 10 \times 10^{-6} \text{ F}$). Solving for τ , we get:

$$\begin{aligned} \tau &= RC \\ \tau &= (10 \text{ ohms}) * (10 \times 10^{-6} \text{ F}) \\ \tau &= 100 \mu\text{s} \end{aligned}$$
