In the graph-based approach, a segmentation S is a partition of V into components such that each component (or region) $C \in S$ corresponds to a connected component in a graph $G_0 = (V, E_0)$, where $E_0 \subseteq E$. As applied in the field of computer vision, graph cut optimization can be employed to efficiently solve a wide variety of low-level computer vision problems (early vision), such as image smoothing, the stereo correspondence problem, image segmentation, object co-segmentation, and many other computer vision problems ...

What are graph based methods for image processing? Graph based image processing methods typically operate on pixel adjacency graphs, i.e., graphs whose vertex set is the set of image elements, and whose edge set is given by an adjacency relation on the image elements. $d(v,w) = \sqrt{(v_x - w_x)^2 + (v_y - w_y)^2}$.
