What is the most common problem with the 5.4 triton? The most popular issue but easiest to fix, is the ignition system. The 3 valve 5.4L Triton contains a coil-on-plug design. Each cylinder has a separate coil that fits onto the spark plug. The design is very efficient but can lead to excessive heat.

What year did the Ford 5.4 have problems? The second generation 5.4L, produced from 2004 to 2014, has three valves per cylinder. This one has several problems, some of which are related to inadequate oiling. Upon tearing apart failing engines, mechanics discovered the buildup of sludge and debris clogging the oil passages, particularly in the cylinder heads.

They have had some issues with blowing spark plugs out but the trick is to not keep the spark plugs in them for 100K, but instead change them out at about 50K.

What is the life expectancy of a 5.4 Triton? If maintained, run for 300K+ miles.
