### **Today's Technician: Automatic Transmissions and Transaxles 3e**

#### **1. What are the main components of a modern automatic transmission?**

Answer: Torque converter, planetary gear sets, clutches and bands, hydraulic control system, and electronic control module.

#### **2. How does a torque converter work?**

Answer: It uses hydraulic fluid to transfer torque from the engine to the transmission. The fluid flows through the impeller, turbine, and stator, creating a centrifugal force that multiplies torque.

#### **3. Explain the operation of a planetary gear set.**

Answer: A planetary gear set consists of a sun gear, planet gears, and a ring gear. The planet gears rotate around the sun gear and are held in place by the ring gear. By engaging and disengaging different clutches and bands, the gear set can create different gear ratios.

#### **4. What is the role of the hydraulic control system in an automatic transmission?**

Answer: The hydraulic control system uses fluid pressure to control the clutches and bands. It monitors transmission inputs and outputs, such as speed and load, and

adjusts the fluid pressure accordingly to engage or disengage the appropriate components.

## **5. How has electronic control affected automatic transmissions?**

Answer: Electronic control has significantly improved the efficiency, performance, and durability of automatic transmissions. Electronic control modules (ECMs) monitor numerous sensors and control various components, including the torque converter clutch, shift solenoids, and governor. This allows for precise and adaptive control, resulting in smoother shifts, better fuel economy, and enhanced overall transmission performance.
