**What are the three 3 main parts of web services?**

**What are the basic steps of implementing web services?** Web Service implementation can be provided by creating new Web services, transforming existing applications into Web services, and composing new Web services from other Web services and applications.

**What is the difference between API and web services?** A key difference between web service and API is the way that software applications or machines communicate. With web service, a network is required to transfer information. However, with an API a network is optional. APIs are also commonly leveraged on internal databases and do not require a network.

**What are the four 4 basic standards for web services?** The following standards play key roles in Web services: Universal Description, Discovery and Integration (UDDI), Web Services Description Language (WSDL), Web Services Inspection Language (WSIL), SOAP, and Web Services Interoperability (WS-I).

**What is an example of a web service API?** Most web services provide an API, which, with its set of commands and functions, is used to retrieve data. Here's one example: Twitter delivers an API that authorizes a developer access tweets from a server and then collects data in JSON format.

**What is web services architecture?** The architecture of web service consists of three roles: service provider, service requester, and service registry. The interaction consists of three operations: publish, find, and bind. These operations and roles act upon the artifacts of web services.

**How do you develop and deploy a web service?**

**What protocol is used to access web services?** Simple Object Access Protocol(SOAP) and Representational State Transfer (REST) are by far the most used options for accessing web services, however they are not directly comparable

as they vary in the sense that SOAP is a communications protocol while REST is a set of architectural principles for data transmission.

**What are the cores of web service architecture?** The Web Service Architecture describes how to instantiate the elements and implement the operations in an interoperable manner. The architecture of web service consists of three roles: service provider, service requester, and service registry. The interaction consists of three operations: publish, find, and bind.

**What is the role of the Web architecture?** Web architecture is the process of designing, creating and implementing an internet-based computer program. Often, these programs are websites that contain useful information for a user, and web developers may design these programs for a particular purpose, company or brand.

**What are the core architecture responsibilities?** Prepare detailed blueprints and specification documents using programs like Computer Aided Design (CAD) and/or Building Information Modeling (BIM); share documents with a client to get final approval; work with other professionals (like plumbers or electricians) to include more technical details; create finalized ...

**What does the core of the Web services always use?** Web applications always use HTTP/HTTPS protocol whereas traditional web services use SOAP protocol. Recently REST is getting popularity that is an architecture style and almost all times run on HTTP/HTTPS protocol. Web applications are not meant for reusability whereas this is one of the benefit of web services.
