Trading the Measured Move

What is a measured move?

A measured move is a technical analysis technique that attempts to predict the extent of a price move after a breakout from a trading range. It involves measuring the height of the range and adding or subtracting that distance from the breakout point.

How do you calculate a measured move?

For a bullish measured move, measure the height of the trading range from the low to the high. Add this distance to the breakout point. For a bearish measured move, measure the height of the range from the high to the low and subtract this distance from the breakout point.

When do you use a measured move?

Measured moves are typically used after a breakout from a trading range, indicating a potential trend change. They can provide a target for profit-taking or identify potential areas of support or resistance.

Are measured moves reliable?

Measured moves are not foolproof and should be used in conjunction with other technical analysis techniques. They can be helpful for identifying potential price targets, but they do not guarantee successful trades.

What are some limitations of measured moves?

Measured moves can be inaccurate if the price action following the breakout does not conform to the expectations. They can also be affected by factors such as news events, market volatility, and changes in sentiment.
