31+ SQL Server Interview Questions and Answers (Part 5)

Question 15: What are the different types of database users in SQL Server?

Answer: Database users include SQL logins for external authentication and Windows logins for integrated authentication. Each user can be assigned specific roles and permissions within the database.

Question 16: Explain the concept of a transaction in SQL Server. Answer: A transaction is a logical unit of work that either commits successfully or rolls back any changes if an error occurs. It ensures data integrity by maintaining Atomicity, Consistency, Isolation, and Durability (ACID) properties.

Question 17: What is the purpose of the WITH (NOLOCK) hint? Answer: The WITH (NOLOCK) hint instructs SQL Server to skip acquiring locks on the specified table. This improves query performance but can lead to dirty reads where uncommitted changes may be visible.

Question 18: Describe the difference between PRIMARY KEY and UNIQUE constraints. Answer: A PRIMARY KEY constraint identifies a unique row within a table and cannot be null. A UNIQUE constraint also enforces uniqueness but allows null values.

Question 19: What is the difference between a clustered index and a non-clustered index? Answer: A clustered index physically stores data in the order of the index key, optimizing performance for queries that involve retrieving data in that order. Non-clustered indexes store data separately from the table, allowing faster

access to data based on specific columns.
