Solution Manual: Probability and Decision for Civil Engineers

Understanding Probabilistic Analysis in Civil Engineering

Probability theory plays a vital role in civil engineering, providing a framework for analyzing and assessing risks in design, construction, and maintenance. The "Solution Manual: Probability and Decision for Civil Engineers" offers a comprehensive set of solutions to problems presented in the textbook, enabling students and practitioners to solidify their understanding of probabilistic concepts.

Example Question: Reliability Assessment

Determine the probability of failure of a structural component with a probability density function $f(x)$ and a target strength of R .

Solution:

The probability of failure is given by the integral of $f(x)$ from R to infinity:

$$P(\text{Failure}) = \int_{[R, \infty)} f(x) \, dx$$

Example Question: Decision Making Under Uncertainty

A civil engineer must decide whether to use a new material or a traditional material for a project. The new material has a 70% chance of performing satisfactorily and a 30% chance of failing, while the traditional material has a 50% chance of performing satisfactorily and a 50% chance of failing. The engineer's utility for satisfactory performance is 100 and for failure is -20. Which material should the engineer

choose?

Solution:

The expected utility for each material is:

- New material: $(0.7 \cdot 100) + (0.3 \cdot -20) = 64$
- Traditional material: $(0.5 \cdot 100) + (0.5 \cdot -20) = 40$

Therefore, the engineer should choose the new material.

Example Question: Bayesian Analysis

A soil sample is tested for a particular property, and the result is x . The prior belief that this property has a value θ is given by a normal distribution with mean μ and standard deviation σ . The likelihood function for the test result is also normal, with mean x and standard deviation s . Determine the posterior distribution for θ .

Solution:

The posterior distribution is given by:

$$f(\theta | x) \propto f(x | \theta) f(\theta)$$

which is also a normal distribution with mean θ^* and standard deviation σ^* :

$$\theta^* = (\mu \sigma^2 + s x^2) / (\sigma^2 + s^2)$$

$$\sigma^{*2} = (\sigma^2 s^2) / (\sigma^2 + s^2)$$

Example Question: Monte Carlo Simulation

A civil engineer wants to estimate the probability of a flood occurring in the next year. The annual flood discharge is modeled by an exponential distribution with a mean of 50,000 cubic feet per second. Use Monte Carlo simulation to generate a sample of 100 flood discharges and estimate the probability of a flood exceeding 75,000 cubic feet per second.

Solution:

- Generate 100 random numbers from the exponential distribution.

- Calculate the flood discharge for each random number.
- Count the number of flood discharges that exceed 75,000 cubic feet per second.
- Divide the count by 100 to estimate the probability.
