Stock Solution Preparation: Questions and Answers

What is a stock solution?

A stock solution is a concentrated solution that is used to prepare more dilute solutions. It is typically prepared by dissolving a known weight of a solute in a known volume of solvent. The concentration of the stock solution is expressed in units of moles per liter (M).

How do you prepare a stock solution?

To prepare a stock solution, you will need to know the following information:

- The molarity of the stock solution you want to prepare
- The molecular weight of the solute
- The volume of stock solution you want to prepare

Once you have this information, you can use the following formula to calculate the weight of solute you need to dissolve:

Weight of solute (g) = Molarity (M) x Molecular weight (g/mol) x Volume of stock solution (L)

Once you have calculated the weight of solute, you can dissolve it in the solvent and transfer it to a volumetric flask. Fill the flask to the mark with solvent and mix thoroughly.

How do you store a stock solution?

Stock solutions should be stored in a cool, dark place. The container should be tightly sealed to prevent evaporation. Stock solutions can typically be stored for several months.

How do you use a stock solution?

Stock solutions can be used to prepare more dilute solutions. To do this, you will need to know the following information:

- The concentration of the stock solution
- The concentration of the dilute solution you want to prepare
- The volume of dilute solution you want to prepare

Once you have this information, you can use the following formula to calculate the volume of stock solution you need to use:

Volume of stock solution (mL) = Concentration of dilute solution (M) x Volume of dilute solution (mL) / Concentration of stock solution (M)

Once you have calculated the volume of stock solution, you can transfer it to a volumetric flask and add solvent until the flask is filled to the mark. Mix thoroughly and your dilute solution is ready to use.

What are some common mistakes that people make when preparing stock solutions?

Here are some common mistakes that people make when preparing stock solutions:

- Using the wrong solvent
- Using the wrong weight of solute
- Not dissolving the solute completely
- Not calibrating the volumetric flask
- Not storing the stock solution properly
