How do veins help keep blood flowing in the right direction? Small veins lead to larger and larger veins as the blood approaches the heart. Valves in the veins keep blood flowing in the correct direction. Two large veins that lead into the heart are the superior vena cava and inferior vena cava.

How does the 4 chambered heart evolve? Changes required to evolve the four-chambered heart from the three-chambered design include the development of a forked abdominal aorta into a single aorta and a major alteration in the heart septum in order to create a separate ventricle chamber.

What blood vessels carry blood ejected from the two away from the heart? Arteries. Arteries carry oxygen-rich blood away from the heart to all of the body's tissues.

What structures prevent blood from flowing backwards through the heart? Heart valves The valves prevent blood from flowing backward. The heart has four valves. The tricuspid valve separates the right atrium and right ventricle. The mitral

valve separates the left atrium and left ventricle.

What prevents backflow into the ventricles when the heart is relaxed? The two semilunar valves, the pulmonary and aortic valves, are closed, preventing backflow of blood into the right and left ventricles from the pulmonary trunk on the right and the aorta on the left.
