Normalization of Deviance is when what was unacceptable becomes acceptable. In the case of the Challenger disaster damage to the O-ring joint sealing the solid rocket booster sections was considered unacceptable.

**How do you breed a channa striata?** The Present study reveals that, Channa striata can be successfully bred under the conditions in Trial 3 using hormonal stimulation of Ovulin® (GnRH+Domperidon) with 0.5ml/kg for female and 0.2 ml/kg for male, environmental conditions and the substrate.

**What precautions should be taken during induced breeding?** Precautions for Induce Breeding (1) To avoid diseases and parasitic infections, (2) Breeders should be properly washed with KMnO<sub>4</sub> solution for a few minutes. (3) Breeder should be protected from mechanical injuries during handling.

**What are the disadvantages of induced breeding?** Reduced genetic diversity: By relying on a limited number of breeding animals, induced breeding can lead to a reduction in genetic diversity within a population, when animals are kept in overcrowded conditions, this increases the likelihood of becoming sick and

experiencing other health issues.

**What are the breeding behaviors of fish?** As part of the reproductive cycle, fish engage in various breeding behaviors. Depending on the species, these behaviors can be elaborate and include activities such as bubble-nesting, chasing, courting dances, and more. However, the most common mating behavior is the pair formation between males and females.

**What is the lifespan of a Channa?** Results indicated that fish age ranged from 1-5 years but the majority of the samples belonged to 2-3 years of age. The parameters of von Bertalanffy growth functions showed the  $L_{\infty} = 89.4$  cm (TL),  $k = 0.105$  year<sup>-1</sup> and  $t_0 = -0.93$ . Length-weight relationship exhibited negative allometric growth in *Channa striata*.

**What are the factors affecting induced breeding?** Certain environmental parameters like photoperiods, rain, temperature, current of water influence the hormonal activity from pituitary and gonads. release of hormones in captive conditions and thus, the fish does not breed in captivity. It gives pure spawn of certain species of fishes under cultivation.

**What are the benefits of induced breeding?**

**What is breeding hapa?** The breeding hapa is a box-like enclosure (2 m x 1.5 m x 1.0 m) stitched out of square-meshed mosquito netting cloth and tied on to bamboo poles fixed in ponds or tanks so that about 0.3 m is above the water level while its bottom is 0.3 m above the pond bottom. Normally the hapa has a plain cloth cover on the top.

**Why is being induced not good?** Labor induction raises the risk that the uterine muscles won't contract the way they should after giving birth. This condition, called uterine atony, can lead to serious bleeding after a baby is born.

**What are 3 cons of selective breeding?**

**What is the method of inducing?** In the NHS context, choice of induction method is typically between prostaglandins and oxytocin combined with artificial rupture of membranes.

**What is the method of breeding?** Classical breeding methods used for decades are pedigree, bulk, recurrent selection, backcross, and single-seed descent. More detailed information about the breeding methods is available in Plant Breeding Methodologies by Neal Jensen.

**What is the transgenic breeding method?** The most commonly used method for this is microinjection [79], in which several hundred copies of the linear transgene DNA is injected into a pronucleus of a one-cell embryo. After injection, eggs are transferred into pseudo-pregnant animals.

**What is the method of selective breeding?** Selective breeding (also called artificial selection) is the process by which humans use animal breeding and plant breeding to selectively develop particular phenotypic traits (characteristics) by choosing which typically animal or plant males and females will sexually reproduce and have offspring together.
