What is the network question answer? A network consists of two or more computers that are linked in order to share resources (such as printers and CDs), exchange files, or allow electronic communications. The computers on a network may be linked through cables, telephone lines, radio waves, satellites, or infrared light beams.

What are the 4 types of network?

What is a networking question? Job-specific speed networking questions: What does a typical day look like for you? What is your favorite—and least favorite—part of your job? What's the biggest project you're currently working on? What is the most challenging part of your job? How do you overcome those challenges?

What are the 7 types of network?

What is a network example? Networks are classified by transmission type as either wireless or wired. Examples of wireless networks include Wi-Fi networks based on the IEEE 802.11 standard, or the LTE networks used for mobile devices and smartphones. Wired networks such as DSL are also known as broadband Internet.

What are the 4 networks? According to a study by RootMetrics, EE is the provider of the best mobile coverage across the UK. If you're in England or Wales, Vodafone is the second-best option, while Northern Ireland and Scotland's runner up is O2. BT is one of the newer players in the market, using its branded services on EE's UK network.

What are the 3 basic types of network? Mainly there are three types of computer networks: LAN (Local Area Network), WAN (Wide Area Network), and MAN (Metropolitan Area Network).

What is IP no? An Internet Protocol (IP) address is the unique identifying number assigned to every device connected to the internet. An IP address definition is a numeric label assigned to devices that use the internet to communicate.

What are the 7 levels of network? In the OSI reference model, the communications between a computing system are split into seven different abstraction layers: Physical, Data Link, Network, Transport, Session, Presentation, and Application.

What is a TCP IP network? TCP/IP stands for Transmission Control Protocol/Internet Protocol and is a suite of communication protocols used to interconnect network devices on the internet. TCP/IP is also used as a communications protocol in a private computer network -- an intranet or extranet.

Why is it called network? The simplest way of explaining the Internet is to call it "the network of networks." It's the connection of computer networks around the world

into one entity, so to speak. It's not one big computer, but rather numerous networked computers connected together.

How to effectively network?

What does LAN stand for? A local area network (LAN) is a collection of devices connected together in one physical location, such as a building, office, or home. A LAN can be small or large, ranging from a home network with one user to an enterprise network with thousands of users and devices in an office or school.

What is a router in a network? A router is a device that connects two or more packet-switched networks or subnetworks. It serves two primary functions: managing traffic between these networks by forwarding data packets to their intended IP addresses, and allowing multiple devices to use the same Internet connection.

What are the 3 main types of network hardware? The seven pieces of network hardware are routers, switches, modems, access points, firewalls, network interface cards, and hubs.

How to solve network problems?

Why do we need a network? Networks allow computers to share and access resources with other computing devices connected to it. Data and information: Networks allow computers to share data and information.

What is the difference between network and Internet? A network is a connection of two or more computers or devices that allows for internal communication and collaboration between the users of those devices. The internet is a global connection of multiple networks that allows a user to access information and data remotely.

What are the two main types of networks?

What is the difference between a LAN and a WAN? LAN means local area network. WAN means wide area network. LANs connect users and applications in close geographical proximity (same building). WANs connect users and applications in geographically dispersed locations (across the globe).

What is a Wi-Fi network? Wi-Fi is a wireless networking technology that allows devices such as computers (laptops and desktops), mobile devices (smart phones and wearables), and other equipment (printers and video cameras) to interface with the Internet.

Is WAN wired or wireless? Though WANs cover a wide area, connections can be either wired or wireless.

What is the difference between a LAN and a PAN? PANs and LANs are unique in their own ways. The major difference between these networks is that a PAN connects devices within the short range of a person, whereas a LAN connects devices at a single site, typically an office building. Similar to a PAN, a LAN can be both wired and wireless.

What type of network is the Internet? Answer and Explanation: The internet is a very good example of a public WAN (Wide Area Network). One distinction of WAN as compared to other types of networks is that it involves or covers a very large area, like a whole country or even the whole world.

What is DHCP? What is DHCP? Dynamic Host Configuration Protocol (DHCP) is used to dynamically assign Internet Protocol (IP) addresses to each host on your organization's network. In this DHCP meaning, a host can refer to any device that enables access to a network.

What is IPv4 and IPv6? IPv4 and IPv6 are connectionless protocols that use multi-packet routing to break data into smaller blocks to send across the internet. IPv4 and IPv6 determine the path each of these packets take, meaning packets from the same piece of data may take different internet traffic routes across the internet.

What is the TCP IP address? An IP address is a 32-bit number. It uniquely identifies a host (computer or other device, such as a printer or router) on a TCP/IP network. IP addresses are normally expressed in dotted-decimal format, with four numbers separated by periods, such as 192.168. 123.132.

What is internet network answer? What is the Internet? The Internet is a vast network that connects computers all over the world. Through the Internet, people can share information and communicate from anywhere with an Internet connection.

What is this network problem? What is a Network Problem? Lag, buffering, bad call quality, and no internet connection are examples of network problem symptoms. If you're unable to enjoy the online content you want, there's a good chance your network is to blame.

What is network security answers? Network security refers to the technologies, policies, people, and procedures that defend any communication infrastructure from cyberattacks, unauthorized access, and data loss. In addition to the network itself, they also secure traffic and network-accessible assets at both the network edge and inside the perimeter.

What is network vs Internet? A network is a connection of two or more computers or devices that allows for internal communication and collaboration between the users of those devices. The internet is a global connection of multiple networks that allows a user to access information and data remotely.

What is network short answer? A network is basically a collection of computers and other devices that are linked together to exchange data. Each device on the network is referred to as a node, and each node has its own address, which is a numerical value.

How do networks work? Computer networking refers to interconnected computing devices that can exchange data and share resources with each other. These

networked devices use a system of rules, called communications protocols, to transmit information over physical or wireless technologies.

What are the 4 types of wireless networks? There are four types of wireless networks -- wireless local area networks, wireless metropolitan area networks, wireless personal area networks and wireless wide area networks -- each with its own function. Below we discuss the different types of wireless networks and the various equipment and connections they require.
