orbitals, the d-subshell has five orbitals, and the f-subshell has seven orbitals. Each type of orbital has a different shape. Each orbital can only hold two electrons.

What is the n/l rule? The (n+l) rule, also known as the Aufbau principle or Aufbau sequence, determines the energy of all atomic orbitals. The rule says that the orbital having a lower value of (n+l) is filled first. If two orbitals have the same n+l, the one with lower n is filled first. The first orbital we fill in is the 1s orbital.
