**1. What is the significance of the cell membrane?** The cell membrane, also known as the plasma membrane, is a critical component of cells. It acts as a barrier, regulating the movement of molecules into and out of the cell. The membrane also contains receptors that facilitate communication between cells and their environment.

**2. How do cells obtain energy?** Cells primarily obtain energy through a process called cellular respiration. This process occurs in the mitochondria and involves the breakdown of glucose, releasing energy that is used to produce ATP (adenosine triphosphate), the cell's energy currency.

**3. What is the role of DNA in cells?** DNA (deoxyribonucleic acid) is a molecule found in the nucleus of cells. It carries the genetic instructions necessary for the development and function of organisms. DNA is organized into genes, which provide the blueprints for synthesizing proteins and other molecules.

**4. How do cells communicate with each other?** Cells communicate with each other through a variety of mechanisms, including cell-to-cell contact, signaling molecules, and hormonal pathways. These communication pathways allow cells to coordinate their activities and respond to changes in their environment.

**5. What are the stages of the cell cycle?** The cell cycle is the process by which cells grow and divide to produce new cells. It consists of four main stages: interphase (cell growth), prophase (chromosome condensation), metaphase (chromosome alignment), and anaphase (chromosome separation).
