Take-Home Exam for the Molecular Genetics Review (Biol 110)

Question 1: Explain the structure and function of DNA.

Answer: DNA is a double-stranded molecule composed of deoxyribonucleotides. Each nucleotide consists of a nitrogenous base (adenine, thymine, cytosine, or guanine), a deoxyribose sugar, and a phosphate group. The two strands of DNA are antiparallel and complementary to each other, forming the iconic double helix structure. DNA carries the genetic information that encodes the structure and function of organisms.

Question 2: Describe the process of DNA replication.

Answer: DNA replication is a semi-conservative process during which a parent DNA molecule serves as a template for the synthesis of two new daughter DNA molecules. It occurs in three main steps: initiation, elongation, and termination. DNA polymerase is the enzyme responsible for adding new nucleotides to the growing DNA chain, following the complementary base pairing rules.

Question 3: Explain the central dogma of molecular biology.

Answer: The central dogma of molecular biology describes the flow of genetic information from DNA to RNA to protein. DNA contains the genetic code, which is transcribed into RNA. RNA then serves as a template for protein synthesis, where specific amino acids are assembled into a polypeptide chain. Protein is the functional end product of gene expression.

Question 4: Discuss the role of mutations in genetic variation.

Answer: Mutations are changes in DNA sequences that can arise spontaneously or through environmental factors. They can be harmful, beneficial, or neutral in their effects. Mutations are a source of genetic variation and can drive evolutionary changes in populations over time.

Question 5: Describe the applications of molecular genetics in medicine and biotechnology.

Answer: Molecular genetics plays a crucial role in medicine and biotechnology. It allows for the diagnosis of genetic diseases, personalized medicine, and the development of new therapies. Additionally, molecular genetics is used in biotechnology to create genetically modified organisms (GMOs) for agricultural, industrial, and medicinal purposes.
