Statistics: McClave 12th Edition Solutions - A Complete Guide

The 12th edition of McClave's Statistics textbook is a comprehensive resource for understanding the fundamentals of statistics. The accompanying solutions manual provides detailed answers to all end-of-chapter problems, offering invaluable assistance to students and instructors alike.

Problem 1: Confidence Interval for a Population Mean

For a sample of 100 observations from a normally distributed population with a sample mean of 50 and a sample standard deviation of 10, calculate a 95% confidence interval for the population mean.

Answer:

Using the formula for a confidence interval for a population mean, we have:

$$\bar{x} \pm Z * (s/\sqrt{n})$$

where:

- \bar{x} is the sample mean (50)
- Z is the critical value from the standard normal distribution for a 95% confidence level (1.96)
- s is the sample standard deviation (10)
- n is the sample size (100)

Plugging in the values, we get:

$$50 \pm 1.96 * (10/\sqrt{100}) = 50 \pm 1.96 * 1 = (48.04, 51.96)$$

Therefore, we can be 95% confident that the true population mean lies between 48.04 and 51.96.

Problem 2: Hypothesis Testing for a Population Proportion

A survey of 500 adults found that 250 of them own a smartphone. Test the hypothesis that the population proportion of adults who own a smartphone is equal to 0.5 at a significance level of 0.05.

Answer:

We can use the formula for a hypothesis test for a population proportion:

$$Z = (\hat{p} - p) / \sqrt{p(1-p)/n}$$

where:

- \hat{p} is the sample proportion (0.5)
- p is the hypothesized population proportion (0.5)
- n is the sample size (500)

Plugging in the values, we get:

$$Z = (0.5 - 0.5) / \sqrt{(0.5(1-0.5)/500)} = 0$$

Since the Z-score is 0, the p-value is 1, which is greater than the significance level of 0.05. Therefore, we fail to reject the null hypothesis and conclude that there is not enough evidence to suggest that the population proportion of adults who own a smartphone is different from 0.5.

Problem 3: Analysis of Variance (ANOVA)

An ANOVA was conducted to compare the mean scores of three different groups on a test. The F-statistic was calculated as 4.53 with a p-value of 0.02. Interpret the results.

Answer:

The F-statistic tests whether there is a significant difference between the means of the three groups. The p-value of 0.02 indicates that there is a statistically significant difference between the group means at a significance level of 0.05. This suggests that at least one of the group means is different from the others.

Problem 4: Linear Regression

A researcher collected data on the relationship between hours studied and exam scores. The linear regression equation was found to be $y = 10 + 2x$, where y is the exam score and x is the number of hours studied. Interpret the slope of the regression line.

Answer:

The slope of the regression line (2) represents the change in the exam score for each additional hour of studying. This means that for every extra hour a student studies, they can expect to increase their exam score by 2 points.

Conclusion

The solutions manual for McClave's Statistics 12th Edition provides comprehensive explanations and solutions to all end-of-chapter problems. It serves as an invaluable

resource for students and instructors alike, helping them to understand statistical concepts and apply them to real-world problems.
