[Download Complete File](#)

What is the asbestos awareness? Information, instruction and training for asbestos awareness is intended to give workers and supervisors the information they need to avoid work that may disturb asbestos during any normal work which could disturb the fabric of a building, or other item which might contain asbestos.

How can you help avoid exposure to asbestos? Methods for Controlling Exposure: Avoid dry sweeping, shoveling, or other dry clean-up of dust and debris containing asbestos. Wet materials before and during cutting, breaking, or other work that might release asbestos fibers into the air. Wear protective outer clothing that can be removed and cleaned or discarded.

What are the risks of asbestos exposure? If you breathe asbestos fibers, you may increase the risk of several serious diseases, including asbestosis, mesothelioma and lung cancer. Asbestos exposure may increase your risk for cancers of the digestive system, including colon cancer.

What are the basics of asbestos? Asbestos is a group of fibrous minerals used to strengthen and fireproof materials. Inhaled asbestos fibers become trapped in the body. The fibers cause diseases such as mesothelioma, lung cancer and asbestosis.

What is important info about asbestos? Asbestos has long been recognized as a health threat to humans, because the fibers can be inhaled and are difficult to remove from the lungs. Asbestos can cause health problems when it is breathed into the lungs. Continued exposure increases the amount of fibers that remain in the lungs.

What is the concern about asbestos? If you breathe in asbestos fibers over long periods, it increases your risk for diseases such as lung cancer, mesothelioma, and

asbestosis.

How to manage the risk of asbestos?

How can we reduce the effects of asbestos? Support ordinances and regulations to reduce the level of construction dust. Keep dust down. Use asbestos-free soil or landscape materials to cover gardens and yards that might have asbestos-containing rock or soil. Pave walkways, driveways, or roadways that might have asbestos-containing rock or soil.

How to treat asbestos exposure?

Who is at greatest risk of asbestos?

What is the most common asbestos exposure? By the 1980s, many mining operations and production of goods containing asbestos stopped. However, millions of older buildings in America still contain the original building materials made with asbestos. On-the-job exposure is the most common.

What is the source of asbestos? They may occur in large natural deposits or as contaminants in other minerals (e.g. tremolite asbestos may occur in deposits of chrysotile, vermiculite, and talc). The most commonly occurring form of asbestos is chrysotile, and its fibres are found as veins in serpentine rock formations.

What are the 3 categories of asbestos? They are divided into two sub-groups: serpentine (chrysotile (white asbestos)), which was the most commonly used type of asbestos and amphiboles, which includes crocidolite (blue asbestos), amosite (brown asbestos), tremolite, actinolite and anthophyllite, of which crocidolite was the most commonly used.

Why is it called asbestos? In fact, the word asbestos, first used in England in the fourteenth century, came from the Greek meaning inextinguishable or unquenchable. Before that, ancient Egyptians used asbestos around 6,000 years ago for its heat-resistant properties.

Why is asbestos a problem? When materials that contain asbestos are disturbed or damaged, fibres are released into the air. When these fibres are inhaled they can cause serious diseases. These diseases will not affect you immediately; they often

take a long time to develop, but once diagnosed, it is often too late to do anything.

What is the most important use of asbestos? Because of its fiber strength and heat resistance asbestos has been used in a variety of building construction materials for insulation and as a fire retardant.

How can asbestos be released? Damaged material may release asbestos fibers. This is particularly true if you often disturb it by hitting, rubbing, or handling it, or if it is exposed to extreme vibration or air flow. Sometimes, the best way to deal with slightly damaged material is to limit access to the area and not touch or disturb it.

How can asbestos be identified? In order to be certain of asbestos, samples should be sent to a specialist laboratory. This is the only definitive way to tell whether asbestos is present, and which variation of it is contained in the material. The information laboratories provide can help you deal with its removal/maintenance accordingly.

How does asbestos impact the environment? Asbestos can remain suspended in the air for long periods of time. It can be carried long distances by wind or water before settling, thus contaminating areas far away from its source. Because asbestos does not break down or biodegrade, it poses a significant risk to humans.

What is the risk of asbestos hazard? Damaging the asbestos can release small fibres into the air. Breathing in these asbestos fibres can damage your lung tissue. Over time this may cause lung disease, including asbestosis, lung cancer and mesothelioma. Your risk of lung cancer from breathing in asbestos fibres is also greater if you smoke.

What are the first signs of asbestos exposure?

What is the best way to prevent exposure to asbestos?

What helps asbestos?

What are the guidelines for asbestos exposure? Permissible Exposure Limit (PEL) for asbestos is 0.1 fiber per cubic centimeter of air as an eight-hour time-weighted average (TWA), with an excursion limit (EL) of 1.0 asbestos fibers per cubic centimeter over a 30-minute period. The employer must ensure that no one is

exposed above these limits.

How to manage asbestos?

How does asbestos affect humans? The asbestos fibers irritate and scar lung tissue, causing the lungs to become stiff. This makes it difficult to breathe. As asbestosis progresses, more and more lung tissue becomes scarred. Eventually, your lung tissue becomes so stiff that it can't contract and expand normally.

Where is asbestos found naturally? Asbestos is commonly found in ultramafic rock, including serpentine, and near fault zones. The amount of asbestos that is typically present in these rocks range from less than 1% up to about 25%, and sometimes more. Asbestos is released from ultramafic and serpentine rock when it is broken or crushed.

What is the most common exposure to asbestos? The most important route of exposure to asbestos is Inhalation.

What treatment is used for asbestos? Doctors often prescribe inhalers and medications, including bronchodilators, aspirin and antibiotics, to help those diagnosed with asbestosis manage their symptoms. Patients with hypoxemia should have supplemental oxygen therapy. Some patients benefit from pulmonary rehabilitation or using a humidifier.

What happens if you breathe in asbestos once? If you suspect past exposure to asbestos, try not to panic. The odds of developing a life-threatening condition from one-time exposure are low. If the event was extreme, however, such as the 9/11 terrorist attack that sent hundreds of tons of toxic dust into the air, the risk is higher.

What does asbestos issues mean? Asbestosis (as-bes-TOE-sis) is a chronic lung disease caused by inhaling asbestos fibers. Prolonged exposure to these fibers can cause lung tissue scarring and shortness of breath.

What was asbestos used for? Asbestos has also been used in a wide range of manufactured goods, mostly in building materials (roofing shingles, ceiling and floor tiles, paper products, and asbestos cement products), friction products (automobile clutch, brake, and transmission parts), heat-resistant fabrics, packaging, gaskets, and coatings.

Why is it called asbestos? In fact, the word asbestos, first used in England in the fourteenth century, came from the Greek meaning inextinguishable or unquenchable. Before that, ancient Egyptians used asbestos around 6,000 years ago for its heat-resistant properties.

What does asbestos disease cause? Asbestos-related diseases include cancers such as mesothelioma, lung cancer, ovarian cancer and laryngeal cancer. They also include non-malignant diseases such as asbestosis and pleural plaques. Any amount of asbestos exposure can cause asbestos-related cancer.

How to treat asbestos exposure?

Where is asbestos found naturally? Asbestos is commonly found in ultramafic rock, including serpentine, and near fault zones. The amount of asbestos that is typically present in these rocks range from less than 1% up to about 25%, and sometimes more. Asbestos is released from ultramafic and serpentine rock when it is broken or crushed.

This is the only definitive way to tell whether asbestos is present, and which variation of it is contained in the material. The information laboratories provide can help you deal with its removal/maintenance accordingly.

Why is asbestos harmful? If you inhale or accidentally swallow asbestos, the microscopic fibers can get stuck in your lungs and stay there for years. Over time, they cause inflammation and scarring, which can lead to cancer. Most people don't show symptoms from asbestos exposure immediately.

Why is asbestos fireproof? Asbestos works well as a fire-resistant material because of its chemical properties. It is nonflammable and noncombustible and has a melting point of around 1,600 degrees Fahrenheit. Asbestos consists of lightweight fibers that are stronger than cotton, rayon or nylon.

Which countries still use asbestos? Some countries, such as India, Indonesia, China and Russia, have continued widespread use of asbestos. The most common is corrugated asbestos-cement sheets or "A/C sheets" for roofing and sidewalls.

Is asbestos man-made or natural? Asbestos is a natural mineral fibre, and in the past it was commonly used in building materials due to its insulation and fire-resistant properties. Damaged or disturbed asbestos should be carefully removed by a licensed contractor, to minimise the health risks from inhaling the fibres and dust particles.

Is asbestos a chemical? ? Asbestos is on the Right to Know Hazardous Substance List because it is cited by OSHA, ACGIH, DOT, NIOSH, NTP, DEP, IARC, IRIS and EPA. ? This chemical is on the Special Health Hazard Substance List.

How common is asbestos? Everyone is exposed to asbestos at some point in their life. Low levels of asbestos are virtually everywhere. Most people don't get an asbestos-related disease. People who get an asbestos-related disease tend to have had exposure on a regular basis and over a long period of time.

Why is asbestos used? Asbestos was used extensively in home construction from the early 1940s through the 1970s as highly-effective and inexpensive fire-retardant material and thermal and acoustic insulator. It is now known that prolonged exposure to asbestos fibers can lead to lung disease.

What are the disadvantages of asbestos? Damaging the asbestos can release small fibres into the air. Breathing in these asbestos fibres can damage your lung tissue. Over time this may cause lung disease, including asbestosis, lung cancer and mesothelioma. Your risk of lung cancer from breathing in asbestos fibres is also greater if you smoke.

How does asbestos enter the body? The primary route of asbestos entry into the body is inhalation of air that contains asbestos fibers. Asbestos can also enter the body via ingestion. With dermal exposure, asbestos fibers may lodge in the skin. The air pathway is the most important route of exposure to asbestos.
