Stresses in Beams, Plates, and Shells: Solutions Manual

The "Stresses in Beams, Plates, and Shells" solutions manual is a valuable resource for students and practitioners in the field of solid mechanics. It provides step-by-step solutions to the end-of-chapter problems in the textbook, offering a comprehensive understanding of the concepts covered.

Question 1: Derive the governing equation for bending of a beam, including the boundary conditions.

Answer: The governing equation for bending of a beam is derived from the equilibrium equations, considering the moment equilibrium of an infinitesimal beam element. The boundary conditions are obtained from the support conditions, such as fixed end, pinned end, or roller support.

Question 2: Determine the stresses in a rectangular plate under uniform loading.

Answer: The stresses in a rectangular plate under uniform loading can be determined using the thin plate theory. The solution involves solving the governing differential equation with the appropriate boundary conditions. The stresses are given by the bending moments and membrane forces.

Question 3: Analyze the buckling behavior of a cylindrical shell under axial compression.

Answer: The buckling behavior of a cylindrical shell under axial compression is determined by solving the governing differential equation with the appropriate boundary conditions. The critical buckling load is the minimum load that causes the shell to buckle.

Question 4: Investigate the effects of shear deformation on the bending of a beam.

Answer: The effects of shear deformation can be taken into account by using the Timoshenko beam theory. This theory includes an additional term in the governing equation that accounts for the shear deformation. The solution provides more accurate results for beams with high shear deformations.

Question 5: Develop a finite element model for a shell structure and analyze its stress distribution.

Answer: A finite element model can be developed using computational tools. The model is discretized into a number of elements, and the governing equations are solved for each element. The stress distribution is obtained by interpolating the stresses at the element nodes.
