Will Python replace Perl? Python displaced Perl, when Perl was a dominant scripting language, way back in the 1990s. What motivated people to replace Perl with Python is that we started using scripting languages for serious software with non-trivial complexity.

Is Perl more powerful than Python? Perl and Python are both powerful languages with unique strengths. Perl excels in text processing and offers flexible syntax, while Python stands out for its readability and extensive use in data science, AI, and web development. The choice between them depends on the specific needs and familiarity of the developer.

Why is Perl not used? Perl had PDL and similar but they weren't as fast or as easy to understand and use. Even if Perl is "Naturally far more efficient" than Python, it's still slow enough that for non-trivial calculations you would not want to use it directly.

Why do hackers use Perl? Perl still holds value in the hacker community for exploit writing. It is a great language that can help you manipulate Linux text files and create tools and exploits.

Why is Perl so hard to read? It's very complex and there are lots of operators and special syntaxes. This means that you get short, but complex code with many syntax errors that take some time to sort out. It also means that reading someone else's code is difficult.

What language replaced Perl? PHP, Ruby, C lang, Java, and Python are the most popular alternatives and competitors to Perl.
