

MANUAL FOR A 8312 DISCBINE

[Download Complete File](#)

What is the difference between a discbine and a drum mower? Drum mowers are lighter and smaller than disc mowers, and they can be driven with less horsepower. Disc mowers require hydraulic lifting, and hydraulic lift capabilities can be very handy in cases where you're moving between several small fields. Disc mowers can cut more grass with each path.

Is a discbine a mower conditioner? In fact, New Holland coined the term "Discbine," which has become the popular name that's loosely used to refer to any disc mower-conditioner, regardless of brand. It's no surprise, because even in tough conditions, a genuine Discbine disc mower-conditioner swiftly turns heavy crop into fast-drying windrows or swaths.

How much horsepower does it take to pull a discbine? The 540-rpm drive and low horsepower requirement mean you can mow and condition your crop for fast drying with as little as 65 PTO horsepower.

What to look for when buying a used discbine?

How fast can you mow with a disc mower? 10 mph – easily achievable by a mid-sized utility tractor with a disc or drum mower, assuming it has the horsepower. 15 mph – Possible with a large tractor (category 2 or larger) and drum mower.

Are disc mowers good for hay? Versatility: Disc mowers can be used to harvest a variety of crops, including hay, grass, and other forages.

Is a sickle mower better than a disc mower? A sickle bar mower is the right choice when you need a lightweight machine for your small tractor, or when you are mowing light material in ditch banks and other irregular terrain. They cannot mow at

the higher speeds of drum mowers and disc mowers, and they cannot handle heavy brush like a flail mower can.

What are the disadvantages of a drum mower? The drum mower's heavy weight can be detrimental for tractors with light front ends. Drum mowers are very heavy in relation to other mower types of the same width. This can make maneuverability and transport difficult if there is not sufficient weight holding the front wheels of the tractor down. Windrowing.

What are the disadvantages of a disc mower? Disc Mower Advantages – increased speed; lower risk for clogging; less blade maintenance than sickle mowers. Disadvantages– requires hydraulics; potential to cut grass too short; increased weight of machine; increased cost over sickle bar mower.

What are the benefits of drum mower? Drum mowers are easily the most rugged of the hay mower types. They rarely sustain damage even from striking an unmovable object. This makes them a great choice for contract cutting in unfamiliar fields or for mowing unruly pastures. High ground speeds.

Why use a disc mower caddy? The Frontier Disc Mower Caddy offers responsive handling to take sharp turns with ease. And because the DC1000 provides extra spacing between tractor and disc mower, you get more time to react to field obstacles. Frontier DC1000 Disc Mower Caddy is compatible with Frontier, John Deere, and other Category 2 disc mowers.

Total Hip Arthroplasty: Wear Behaviour of Different Articulations

Introduction

Total hip arthroplasty (THA) is a surgical procedure that involves replacing the damaged hip joint with artificial components. The key to a successful THA is the wear resistance of the bearing surfaces. Different bearing surfaces have different wear characteristics, which can affect the longevity of the implant.

Question: What is the most common bearing surface used in THA?

Answer: The most common bearing surface used in THA is metal-on-polyethylene (MoP). MoP bearings offer a good combination of wear resistance, biocompatibility,

and cost-effectiveness.

Question: What is the wear rate of MoP bearings?

Answer: The wear rate of MoP bearings is typically 0.05-0.1 mm/year. However, the wear rate can vary depending on factors such as patient activity level, implant design, and surgical technique.

Question: Are there any alternative bearing surfaces to MoP?

Answer: Yes, there are several alternative bearing surfaces to MoP available, including metal-on-metal (MoM), ceramic-on-ceramic (CoC), and ceramic-on-polyethylene (CoP). Each bearing surface has its own advantages and disadvantages in terms of wear resistance, biocompatibility, and cost.

Question: What are the advantages of CoC bearings?

Answer: CoC bearings offer excellent wear resistance and biocompatibility. The wear rate of CoC bearings is typically less than 0.01 mm/year, which is significantly lower than that of MoP bearings. CoC bearings are also highly resistant to fracture and can withstand higher loads than other bearing surfaces.

Question: What are the disadvantages of CoC bearings?

Answer: CoC bearings are more expensive than MoP bearings and can be more difficult to implant. In addition, CoC bearings can produce a high-pitched "squeaking" sound during movement, which some patients find unpleasant.

Conclusion

The wear behaviour of different bearing surfaces is an important consideration in THA surgery. MoP bearings are the most common bearing surface used due to their good combination of wear resistance, biocompatibility, and cost-effectiveness. However, alternative bearing surfaces such as CoC and CoP offer advantages in terms of wear resistance and biocompatibility. The choice of bearing surface should be made based on the patient's individual needs and preferences.
