Xam Idea Class 10 Maths: In-depth Question and Answer Overview

Xam Idea Class 10 Maths is a comprehensive study material designed to help students excel in their board examinations. It offers a wide range of questions and answers covering all the chapters of the NCERT syllabus. Here are a few selected questions and answers from this resource:

Chapter 1: Real Numbers

Question: Prove that $\sqrt{5}$ is an irrational number. **Answer:** Let us assume that $\sqrt{5}$ is rational. Then, it can be expressed in the form p/q , where p and q are integers and $q \neq 0$. Squaring both sides, we get $5 = p^2/q^2$. Thus, p^2 is divisible by 5, which implies that p is also divisible by 5 (since p is an integer). Therefore, we can write $p = 5k$ for some integer k . Substituting this back into the original equation, we get $5 = 25k^2/q^2$. This implies that q^2 is also divisible by 5, which in turn implies that q is divisible by 5. But this contradicts our assumption that p and q have no common factors other than 1. Therefore, our initial assumption that $\sqrt{5}$ is rational must be false, and hence it is an irrational number.

Chapter 2: Polynomials

Question: Find the value of k for which $x^2 + kx + 6 = 0$ has equal roots. **Answer:** For a quadratic equation $ax^2 + bx + c = 0$ to have equal roots, the discriminant $b^2 - 4ac$ must be equal to zero. Applying this to the given equation, we get: $k^2 - 4(1)(6) = 0$? $k^2 - 24 = 0$? $k^2 = 24$? $k = \pm\sqrt{24} = \pm 2\sqrt{6}$ Therefore, the value of k for which $x^2 + kx + 6 = 0$ has equal roots is $\pm 2\sqrt{6}$.

Chapter 3: Pair of Linear Equations in Two Variables

Question: Solve the following pair of equations: $2x + 3y = 7$ $x - 2y = -3$ **Answer:** We can use the substitution method or the elimination method. Let's use the substitution method.

From the second equation, we get $x = -2y - 3$. Substituting this into the first equation, we get: $2(-2y - 3) + 3y = 7$? $-4y - 6 + 3y = 7$? $-y = 13$? $y = -13$ Substituting this back into $x = -2y - 3$, we get: $x = -2(-13) - 3 = 23$ Therefore, the solution to the pair of equations is $x = 23$ and $y = -13$.

Chapter 4: Quadratic Equations

Question: Find the nature of the roots of the quadratic equation $x^2 - 5x + 6 = 0$. **Answer:** The nature of the roots of a quadratic equation $ax^2 + bx + c = 0$ is determined by the discriminant $b^2 - 4ac$. In this case, $a = 1$, $b = -5$, and $c = 6$. Therefore, the discriminant is: $b^2 - 4ac = (-5)^2 - 4(1)(6) = 25 - 24 = 1$ Since the discriminant is positive (1), the quadratic equation has two distinct real roots.

Chapter 5: Arithmetic Progressions

Question: Find the n -th term of the arithmetic progression 5, 10, 15, ... **Answer:** In an arithmetic progression, the difference between any two consecutive terms is constant, known as the common difference. In this case, the common difference is 5 ($10 - 5 = 15 - 10 = \dots$). Therefore, the n -th term can be expressed as: $n\text{-th term} = \text{First term} + (n - 1) \times \text{Common difference}$ Substituting the given values, we get: $n\text{-th term} = 5 + (n - 1) \times 5 = 5 + 5n - 5 = 5n$ Therefore, the n -th term of the arithmetic progression is $5n$.
