**What is Computer Organization and operating system?** Computer Organization is realization of what is specified by the computer architecture . It deals with how operational attributes are linked together to meet the requirements specified by computer architecture. Some organizational attributes are hardware details, control signals, peripherals.

**What is PC in computer organization and architecture?** The program counter, also known as the instruction pointer or simply PC, is a fundamental component of a computer's central processing unit (CPU). It is a special register that keeps track of the memory address of the next instruction to be executed in a program.

**What is the difference between Computer Organization and computer architecture?** Difference between Computer Architecture and Computer Organization. Computer Architecture is concerned with the way hardware components are connected to form a computer system. Computer organization is concerned with the structure and behavior of the computer system as seen by the user. It is a blueprint for design.

**What is the structure and organization of a computer?** The main components of the basic structure of computers are the control processing unit (CPU), an input unit, memory unit, control unit, and output unit. Ans. The main functions performed by computers based on their basic structure include output, input, storage, and processing.

**What are the 5 basic organizations of a computer?** A computer consists of five functionally independent main parts input, memory, arithmetic logic unit (ALU), output and control unit.

**What are the six types of computer organization?**

**Is computer system organization hard?** Computer Systems Organization, or CSO, is the third class in NYU CAS's computer science program and arguably the most difficult of the CS curriculum. This is for good reasons. The class covers a lot of ground, from the C language to systems architecture to concurrency.

**What are the four main components of a computer?** There are four main computer hardware components that this blog post will cover: input devices,

processing devices, output devices and memory (storage) devices. Collectively, these hardware components make up the computer system.

**What is CPU in computer organization?** The Central Processing Unit (CPU) is the primary component of a computer that acts as its “control center.” The CPU, also referred to as the “central” or “main” processor, is a complex set of electronic circuitry that runs the machine's operating system and apps.

**What are the four main functions of a computer?** “Computer is a data processing device that performs four major functions: input, process, output, and storage” 2. There are basically four basic functions of computers - input, storage, processing and output.

**What is computer architecture in simple words?** Computer architecture is the organisation of the components which make up a computer system and the meaning of the operations which guide its function. It defines what is seen on the machine interface, which is targeted by programming languages and their compilers.

**Why do we study computer organization and architecture?** The subject explores how machines are designed, built, and operate. Knowing what's inside and how it works will help you design, develop, and implement applications better, faster, cheaper, more efficient, and easier to use because you will be able to make informed decisions instead of guessing and assuming.

**What are the 5 basics of a computer?**

**What are the 7 major components of a computer?**

**What are the 5 main parts of a computer?** Every computer comprises 5 basic parts, namely, a motherboard, a central processing unit, a graphics processing unit, a random access memory, and a hard disk or solid-state drive. Be it a high-end gaming computer system or be it a basic desktop system for kids, every computer consists of 5 parts.

**What is the meaning of computer organization?** Definition: Computer Organization refers to the way in which the various components of a computer system are arranged and connected. It involves the study of the internal working and structuring of a computer system.

**What is computer systems organization?** Answer: The basic organization of a computer system is the processing unit, memory unit, and input-output devices. The processing unit controls all the functions of the computer system. It is the brain of the computer e.g. CPU. The memory unit consists of two units.

**What is organization in operating system?** The organization of an OS identifies the various boundaries between its components and the boundaries between these components and user programs. These boundaries can be logical, that is, visible to the programmer or physical, that is, transparent to the programmer.

**What is computer system and operating system?** The main software component is itself an operating system (OS) that manages and provides services to other programs that can be run in the computer. In its most basic form, a computer system is a programmable electronic device that can accept input; store data; and retrieve, process and output information.
