Structural Steel Design 5th Edition McCormac Solution

Question 1: Determine the allowable axial compressive stress for a W14x22 column with a length of 15 feet and fixed-fixed end conditions.

Solution: Refer to Table 3-4 in the 5th edition of McCormac's Structural Steel Design textbook. For a W14x22 column with a length of 15 feet, the slenderness ratio (KL/r) is 113. The allowable axial compressive stress is approximately 11.4 ksi.

Question 2: Design a welded plate girder to support a uniformly distributed load of 20 tons over a span of 20 feet. The girder is to be made of A36 steel and have a depth of 30 inches.

Solution: First, determine the bending moment and shear force acting on the girder. Then, select a suitable flange and web thickness combination by checking the bending and shear capacities using the AISC Steel Construction Manual. For a depth of 30 inches, a flange thickness of 3/4 inches and a web thickness of 1/2 inch are suitable.

Question 3: A 12-foot long W8x31 beam is simply supported and subjected to a concentrated load of 10 kips at mid-span. Determine the maximum bending stress in the beam.

Solution: Calculate the bending moment at mid-span using the simple beam formula. Then, use the section modulus for the W8x31 beam to determine the bending stress. The maximum bending stress is approximately 20 ksi.

Question 4: Design a composite beam consisting of an 8-inch wide flange beam and a 4-inch concrete slab. The beam has a span of 18 feet and is subjected to a uniformly distributed load of 100 psf.

Solution: Convert the concrete slab to an equivalent steel area using the modular ratio. Combine the moment of inertia of the steel beam and the equivalent concrete area to obtain the transformed section properties. Then, determine the bending stresses in the steel beam and the concrete slab using the transformed section modulus.

Question 5: A 10-story steel frame building is subjected to a seismic force of 200 kips. Determine the base shear force that must be resisted by the columns.

Solution: Use the seismic design provisions of the AISC Steel Construction Manual to calculate the base shear coefficient. Multiply the base shear coefficient by the total dead and live loads to obtain the base shear force. The columns must be designed to resist this force.
