These processes are usually divided into four stages known as preliminary, primary, secondary and tertiary treatments.

What is the operation of the water treatment plant? The raw water is delivered to the headworks of the water treatment plant where the first of 5 major unit water treatment processes start the treatment to make the water safe to drink. The 5 major unit processes include chemical coagulation, flocculation, sedimentation, filtration, and disinfection (described below).

What is the process of settling wastewater? It involves floating the suspended particles to separate them from the clear water. The process has several steps: Water is slowly added to a settling tank so that suspended particles settling to the bottom. The clear decanted water is then pumped from the top of the tank, leaving the impurities at the bottom.

Where do the solids go from a wastewater treatment plant? The water is pumped into sedimentation tanks, where solids and suspended sediment is allowed to settle out of the bottom, and scum rises from the top. This material is removed and incinerated or sent to a landfill.

What is the process called which breaks down the sludge form of wastewater? This is because treating sludge through a process called “anaerobic digestion” allows water companies to recover biogas out of the material and make the biosolids a nutrient-rich soil product. Some go further and retrieve from the sludge minerals such as phosphorus, a non-renewable resource.

What kind of solids does the wastewater treatment plant do little to remove? When wastewater arrives at the treatment plant, it contains many solids that cannot be removed by the wastewater treatment process. This can include rags, paper,
