Which Comes First, Cardio or Weights? Fitness Myths and Truths

For decades, fitness enthusiasts have debated the optimal order for cardio and weight training. While traditional wisdom dictated performing cardio first to warm up the body, recent research has shed new light on this question.

Cardio First or Weights First?

According to exercise physiologist Alex Hutchinson, author of the book "Which Comes First, Cardio or Weights?," there is no definitive answer. "Studies have shown both benefits and drawbacks to either order," he says. For general fitness, Hutchinson recommends performing cardio first to improve cardiovascular health and endurance. However, for individuals interested in building muscle, it may be more beneficial to prioritize weight training first.

The Science Behind the Myth

The myth that cardio should always come first arose from the belief that it was necessary to warm up the body before performing resistance training. However, research has shown that light weightlifting can effectively warm up the muscles without the need for extended cardiovascular exercise. Additionally, performing cardio prior to weights may lead to reduced performance and muscle damage.

Weight Training First

When weight training is performed first, the body's glycogen stores are high, providing fuel for intense resistance exercises. This allows for optimal muscle recruitment and growth. Moreover, weight training stimulates the release of hormones that further promote muscle building.

Cardio Second

Performing cardio after weight training allows the body to recover from the strenuous activity and prolong endurance. Cardio also aids in removing waste products accumulated during weight training, promoting muscle recovery and reducing soreness.

Other Surprising Discoveries

Beyond the cardio vs. weights debate, Hutchinson shares other intriguing discoveries from exercise science:

- Exercise intensity, not duration, is more important for improving cardiovascular health.
- Resistance training can be just as effective as cardio for weight loss.
- Rest intervals between sets should be tailored to individual fitness levels.
- It is crucial to listen to your body and avoid overtraining.

Conclusion

The optimal order of cardio and weight training depends on individual fitness goals. While cardio first may be beneficial for general fitness, weight training first is recommended for building muscle. Ultimately, a well-balanced fitness routine should include both cardio and weights, performed in an order that aligns with your specific objectives.
