Question 1: A force of 500 N is applied to a rigid body. Calculate the moment of the force about a point 10 cm from its line of action.

Answer: The moment of a force is calculated as the product of the force and the perpendicular distance from the force to the point of interest. Therefore, the moment of the 500 N force about the point 10 cm from its line of action is $500 \text{ N} \times 0.1 \text{ m} = 50 \text{ Nm}$.

Question 2: A cantilever beam of length L is subjected to a point load P at its free end. Determine the maximum bending stress in the beam.

Answer: The maximum bending stress in a cantilever beam occurs at the fixed end and is given by the formula $\sigma = (3/2)PL/bh^2$, where P is the point load, L is the beam length, b is the beam width, and h is the beam height.

Question 3: A column of height h is subjected to a compressive axial load P . Analyze the buckling stability of the column using the Euler buckling formula.

Answer: The Euler buckling formula predicts the critical load at which a column will buckle laterally. It is given by $P = (\pi^2 EI)/(h^2)$, where E is the elastic modulus of the column material, I is the moment of inertia of the column cross-section, and h is the column height.

Question 4: A circular shaft of diameter d is subjected to a torque T . Calculate the maximum shear stress in the shaft.

Answer: The maximum shear stress in a circular shaft subjected to torque is given by the formula $\tau = Tc/J$, where T is the torque, c is the shaft radius, and J is the polar moment of inertia of the shaft cross-section.

Question 5: A thin-walled cylindrical pressure vessel is subjected to an internal pressure p . Determine the hoop stress and axial stress in the vessel walls.

Answer: The hoop stress in a thin-walled cylindrical pressure vessel is given by $\sigma_{\text{hoop}} = pr/t$, where p is the internal pressure, r is the vessel radius, and t is the vessel wall thickness. The axial stress is given by $\sigma_{\text{axial}} = pr/(2t)$.
