## **Statistics Chapter 10 Answers: Hypothesis Testing**

Hypothesis testing is a statistical method used to determine if there is evidence to support or reject a claim about a population parameter. The process involves setting up a null hypothesis ( $H_0$ ) and an alternative hypothesis ( $H_a$ ), collecting data, calculating a test statistic, and making a decision based on the p-value.

**Question 1:** What is the null hypothesis and alternative hypothesis in hypothesis testing?

**Answer:** The null hypothesis is the statement that there is no difference or effect, while the alternative hypothesis is the statement that there is a difference or effect.

**Question 2:** How is the test statistic calculated?

**Answer:** The test statistic is a measure of the difference between the sample statistic and the hypothesized population parameter. It is calculated using a formula that is specific to the type of hypothesis test being conducted.

**Question 3:** What is the p-value and how is it used?

**Answer:** The p-value is the probability of obtaining a test statistic as extreme as or more extreme than the one observed, assuming that the null hypothesis is true. A small p-value (less than 0.05) provides evidence against the null hypothesis,

indicating that the alternative hypothesis is more likely to be true.

**Question 4:** What are the four possible decisions in hypothesis testing?

**Answer:** The four possible decisions are: (1) reject  $H_0$  and accept  $H_a$ , (2) fail to reject  $H_0$  and fail to accept  $H_a$ , (3) reject  $H_0$  and fail to accept  $H_a$ , and (4) fail to reject  $H_0$  and accept  $H_a$ .

**Question 5:** What is a Type I error and a Type II error?

**Answer:** A Type I error is rejecting the null hypothesis when it is actually true, while a Type II error is failing to reject the null hypothesis when it is actually false. The significance level of a hypothesis test determines the probability of making a Type I error.
