What factors make a pendulum swing slower or faster? The variable to change is the length of the string. This is the only variable (that we can easily change) that affects the period of a pendulum.

What is the reason that a pendulum bob swings past equilibrium when going back and forth? As the pendulum swings, the force of gravity causes it to accelerate towards the center of the arc, which is the point of equilibrium. This acceleration causes the pendulum to swing in an arc rather than going through the same point.

What factors may affect the time taken for one complete swing of the pendulum? The only things that affect the period of a simple pendulum are its length and the acceleration due to gravity. The period is completely independent of other factors, such as mass.

What is the interference of waves Class 11? The interference of waves can be witnessed when two waves travel along with the same medium. This phenomenon occurs when two waves meet or superimpose while travelling. The resultant wave is formed when two waves interfere.

When two waves with identical amplitudes going in opposite directions collide, they? Where two identical waves meet, if their peaks and troughs are exactly in phase, they constructively interfere to increase amplitude. If they're exactly out of phase, they destructively interfere and cancel each other out, like this: Is it possible for one wave to cancel another wave, so that no amplitude remains?

What is a wave interference that results in lesser wave amplitude called? Destructive interference definition is a situation that occurs when the crests and troughs of two interfering waves meet, and their amplitudes cancel out.
