Wheel and Pinion Cutting in Horology: A Historical Guide

1. What are wheels and pinions in horology?

Wheels and pinions are essential components of a mechanical watch or clock. Wheels are round discs with teeth cut into their edges, while pinions are small wheels with teeth on their circumference. The teeth of wheels and pinions engage with each other to transmit power and motion within the timepiece.

2. How were wheels and pinions traditionally cut?

Traditionally, wheels and pinions were cut by hand using a file or a small milling machine. The process was laborious and time-consuming, and required a high level of craftsmanship. As a result, early timepieces were often inaccurate and unreliable.

3. When were automated wheel and pinion cutting machines invented?

In the late 18th century, inventors began to develop automated machines for cutting wheels and pinions. These machines used a variety of cutting tools to remove material from the blanks, creating precise teeth that engaged with each other smoothly.

4. How did automated wheel and pinion cutting machines impact watchmaking?

Automated wheel and pinion cutting machines revolutionized watchmaking. They enabled manufacturers to produce gears with greater precision and in larger quantities, which led to more accurate and reliable timepieces. As a result, watches became more affordable and widely available.

5. What are the advantages of modern CNC wheel and pinion cutting machines?

Modern CNC (computer numerically controlled) wheel and pinion cutting machines are even more precise and efficient than their predecessors. They can produce gears with complex tooth profiles and fine pitch in a matter of minutes. This allows watchmakers to create high-performance timepieces with greater accuracy and reliability than ever before.
