## **Transport Processes and Separation Process Principles: Unit Operations 4th Edition**

### **1. What is the driving force for mass transfer?**

Mass transfer occurs due to concentration gradients. In other words, molecules move from areas of high concentration to areas of low concentration to equalize the distribution.

### **2. What are the different types of mass transfer operations?**

Mass transfer operations include:

- Absorption: Transfer of a solute from a gas to a liquid
- Adsorption: Accumulation of a solute on the surface of a solid
- Desorption: Removal of a solute from a solid surface
- Distillation: Separation of liquids based on their boiling points
- Extraction: Separation of solutes between two immiscible liquids

### **3. What is the difference between diffusion and convection?**

Diffusion is the movement of molecules due to random molecular motion. Convection is the movement of molecules due to bulk fluid flow.

### **4. What is a unit operation?**

A unit operation is a physical operation used to transform a raw material into a desired product. Examples of unit operations include:

- Crushing: Reducing the particle size of a solid
- Mixing: Combining two or more materials

- Filtration: Separating solids from liquids
- Heat transfer: Transferring heat from one medium to another

## **5. What are the applications of transport processes and separation process principles?**

These principles have applications in various industries, including:

- Chemical engineering: Design and operation of chemical plants
- Biotechnology: Production of pharmaceuticals and biofuels
- Food processing: Preservation and quality control
- Environmental engineering: Water and wastewater treatment
- Energy production: Fossil fuel combustion and renewable energy generation
