Why Use Pencil on Chromatography Paper?

What is chromatography paper?

Chromatography paper is a type of filter paper that is used to separate mixtures of substances. It is made of a special type of cellulose that is very absorbent and has a high surface area. This makes it ideal for chromatography, which is a technique used to separate substances based on their different rates of movement through a stationary phase.

What is the purpose of using pencil on chromatography paper?

Pencil is used on chromatography paper to mark the starting point of the sample and to identify the different substances that are being separated. The pencil marks act as a reference point for the chromatogram, which is a graph that shows the movement of the substances through the paper.

Why not use pen on chromatography paper?

Pen ink is not used on chromatography paper because it can contain contaminants that can interfere with the separation of the substances. Pencil marks, on the other hand, are made of graphite, which is a non-polar substance that does not interact with the substances being separated.

What type of pencil should be used on chromatography paper?

A soft pencil, such as a 2B or 3B, should be used on chromatography paper. This type of pencil will make a light mark that will not damage the paper.

How to use pencil on chromatography paper:

To use pencil on chromatography paper, simply mark the starting point of the sample and the different substances that are being separated. Be sure to use a light touch so that you do not damage the paper.
