**What are waves' answers?** A wave is a disturbance that carries energy from one place to another. Matter is NOT carried with the wave! A wave can move through matter (a medium). If it must have a medium, it is called a mechanical wave. If it can travel without a medium (such as in space), it is called an electromagnetic wave.

**What wave makes matter in the medium move back and forth at right angles?** In which type of wave do particles move back and forth at right angles to the direction of the wave? Answer: In transverse waves particles move back and forth at right angles to the direction of the wave.

**What is the less dense region of a compressional wave?** In longitudinal waves, compressions (regions of high density) and rarefactions (regions of low density) alternate.

**When a wave strikes an object and bounces off of it?** Reflect- The bouncing back of a wave after it strikes an object.

**What is a wave simple answer?** A wave is a disturbance that travels or propagates from the place where it was created. Waves transfer energy from one place to another, but they do not necessarily transfer any mass. Light, sound, and waves in the ocean are common examples of waves.

**How do you solve for waves?** Wave speed is represented by the variable  $v$ , frequency (cycles per second) by  $f$ , and wavelength (cycle length) by the Greek letter  $\lambda$ . So  $v = f * \lambda$  or solving for  $\lambda$ , the equation becomes  $\lambda = v / f$ . Wave speed has units of distance per unit time, for example, meters per second or m/s. Frequency has

units of Hz.

**In which waves the medium moves at which angles to the wave direction?** A transverse wave is a wave in which particles of the medium vibrate at right angles, or perpendicular, to the direction that the wave travels.

**What type of wave travels up and down?** As the energy is transported from left to right, the individual coils of the medium will be displaced upwards and downwards. In this case, the particles of the medium move perpendicular to the direction that the pulse moves. This type of wave is a transverse wave.

**What type of wave is a sound wave?** In summary, sound waves are a type of mechanical wave that require a medium to travel through. They are longitudinal waves, meaning the particles of the medium vibrate in the same direction as the wave is travelling.

**What is the relationship between distance and amplitude for sound waves?** Indeed, based on what we know about the relationship between distance and intensity (the inverse square law,  $I \propto 1/d^2$ ), we can see that the relationship between distance and amplitude is simply  $A \propto 1/d$ ; amplitude is inversely proportional to distance.

**What wave disturbs matter?** Mechanical waves are caused by a disturbance or vibration in matter, whether solid, gas, liquid, or plasma. Matter that waves are traveling through is called a medium. Water waves are formed by vibrations in a liquid and sound waves are formed by vibrations in a gas (air).

**Which parts of the transverse wave are analogous to the parts of a longitudinal wave?** Sometimes this kind of wave is also called a compressive wave, as it requires pressure on the medium in order to be propagated. In a longitudinal wave, the crest and trough of a transverse wave correspond respectively to the compression, and the rarefaction.

**How are diffraction and refraction similar?** Refraction is the bending of light as it passes from one medium to another, while diffraction is the bending of light as it passes an obstacle or through an aperture. Both behaviors can result in the separation of white light.

**What is the relationship between amplitude and wave energy?** Wave Energy-Amplitude Relationship The energy carried by a wave is directly proportional to the square of its amplitude. This relationship can be expressed mathematically as  $E \propto A^2$ , where E is the energy of the wave and A is its amplitude.

**What type of interference in which overlapping waves add together?** Superposition is the combination of two waves at the same location. Constructive interference occurs when two identical waves are superimposed in phase. Destructive interference occurs when two identical waves are superimposed exactly out of phase.

**What is a single vibratory disturbance moving through a medium called?** pulse.  
Answer: D. A wave is a continuous and repeating disturbance of a medium and a pulse is a single disturbance.

**Are waves means of energy transfer without transfer of matter?** Waves describe the transfer of energy but do not transfer matter. Waves can be either mechanical that transport mechanical, or kinetic, energy, or they can be electromagnetic that transport light and heat energy. When waves transfer energy, particles move perpendicular to the movement of the waves.

**Are water waves transverse or longitudinal?** Water waves are an example of waves that involve a combination of both longitudinal and transverse motions. As a wave travels through the water, the particles travel in clockwise circles. The radius of the circles decreases as the depth into the water increases.

**What increases as amplitude increases?** The correct answer is (D) Increases the volume. The amplitude of a sound wave refers to how "tall" the wave is or how much it displaces air particles as it travels. Sounds with a greater amplitude are louder, or have a higher volume. Thus, increasing the amplitude will increase the volume of the sound.

**Which situation would result in interference?** They describe what happens when two waves meet. Though both types of interference occur when two waves meet, they produce different results. Constructive interference occurs when two waves collide and combine, but destructive interference happens when two waves collide

and cancel out.

**What is the relationship between frequency and energy?** In essence, energy is directly proportional to the frequency of radiation but is inversely proportional to the wavelength. This means that energy increases with an increase in frequency or decrease in wavelength, and energy decreases with a decrease in frequency or an increase in wavelength.

**What is the definition of a wave?** A wave is a disturbance in a medium that carries energy without a net movement of particles. It may take the form of elastic deformation, a variation of pressure, electric or magnetic intensity, electric potential, or temperature.

**How do you describe waves?** Waves are repeating and periodic disturbance that travels through a medium (e.g. water) from one location to another location.

**What is wave one line answer?** A wave is a disturbance that transfers energy and momentum from one point to another in a medium. For example, the wave of the ocean moves in medium water and we can see the movement of the wave crest from one side to the other side in a given time period.

**What are waves 7th grade?** Waves are the disturbances or vibrations that are caused in a media. It is constantly being created and always traveling through different media. Some waves need a medium (matter) to travel through and some waves can travel in empty space or vacuum.
