What is the elementary concept of the solution of a differential equation? For the simplest differential equation $y' = a$, where a is an algebraic function, Liouville showed that if such an equation has an elementary solution, then this solution is an algebraic function plus a sum of constant multiples of logarithms of algebraic functions.

What is differential equation for kids? A differential equation is an equation that contains at least one derivative of an unknown function, either an ordinary derivative or a partial derivative. Suppose the rate of change of a function y with respect to x is inversely proportional to y , we express it as $dy/dx = k/y$.

What is a differential equation for beginners? A differential equation is an equation involving an unknown function $y=f(x)$ and one or more of its derivatives. A solution to a differential equation is a function $y=f(x)$ that satisfies the differential equation when f and its derivatives are substituted into the equation.

What is the basic concept of a differential equation? In Mathematics, a differential equation is an equation that contains one or more functions with its derivatives. The derivatives of the function define the rate of change of a function at a point. It is mainly used in fields such as physics, engineering, biology and so on.

What is the basic solution of a differential equation? A differential equation is an equation involving an unknown function $y=f(x)$ and one or more of its derivatives. A solution to a differential equation is a function $y=f(x)$ that satisfies the differential equation when f and its derivatives are substituted into the equation.

What is the exact solution of a differential equation? $u_x(x, y) = p(x, y)$ and $u_y(x, y) = Q(x, y)$; Therefore, the general solution of the equation is $u(x, y) = C$. Where “C” is an arbitrary constant.

What is the explicit solution of a differential equation? Explicit Solutions. When solving a DE, the best possible result is that we are able to obtain an explicit solution. Definition. If a function $y(x)$ is substituted for y in a DE and satisfies the equation for all x in some interval I , we say it is an explicit solution to the equation on I .
