What is codominance and incomplete dominance in biology? Codominance and Incomplete dominance are two types of genetic inheritance. Codominance essentially means that no allele can block or mask the expression of the other allele. On the other hand, incomplete dominance is a condition in which a dominant allele does not completely mask the effects of a recessive allele.

What is the gene for feather color in some chickens answer key? 2) In some chickens, the gene for feather color is controlled by codominance. The allele for black is B and the allele for white is W. The heterozygous phenotype is known as erminette.

What cross will produce the most pink snapdragons? Figure 21: A cross between a red and white snapdragon will yield 100% pink offspring. This pattern of inheritance is described as incomplete dominance, meaning that neither of the alleles is completely dominant over the other: both alleles can be seen at the same time.

What would be the phenotypic ratio of the offspring of two Erminette chickens? B BB BW 50% of the offspring have genotype BW, 25% are BB, and 25% are WW. This means that 50% of the offspring are erminette, 25% are black, and 25% are white.

What is an example of codominance? Examples of codominance include a person with type AB blood, which means that both the A allele and the B allele are equally expressed. Another example is roan fur in cattle, in which white and red hair is equally expressed.

What is incomplete dominance with an example? Incomplete dominance is a form of Gene interaction in which both alleles of a gene at a locus are partially expressed, often resulting in an intermediate or different phenotype. It is also known as partial dominance. For eg., in roses, the allele for red colour is dominant over the allele for white colour.

What color feathers are codominant in chickens? In chickens, coat color is a CODOMINANT trait, where black (B) and white (W) feathers are BOTH expressed. Individuals that have both alleles are speckled.

What genes are dominant in chickens? Both the rose comb gene and the pea comb gene can express themselves in the heterozygous state. That is, only one copy of the rose comb gene or the pea comb gene is sufficient for that type of comb to occur. Therefore, both genes can be thought of as dominant genes.

What determines bird feather color? Warm colors come straight out of the food birds eat. Melanin isn't the only pigment that leaves its mark on feathers. The next group is called carotenoids, and they create most of the reds, oranges, and yellows in birds.

What happens if you cross a pink with a white? If a plant with pink flowers is crossed with a plant with white flowers, again the flower color types of the offspring are independent of each other, and in this case each offspring plant has pink flowers with probability $1/2$, and white flowers with probability $1/2$.

What results if a black bird is crossed with a bluish gray bird draw a Punnett square? When you cross a black bird with a bluish gray bird, you are crossing genotype BB with genotype BW. The Punnett square should yield two boxes with genotype BB and two boxes with genotype BW.

Is heterozygous incomplete dominance? Incomplete dominance results in heterozygotes with intermediate phenotypes, as in the case of snapdragons when

parents with red flowers and white flowers are crossed resulting in heterozygous offspring with pink flowers.

What is the gene for calico multicolored cats? In cats, the gene for calico (multicolored) cats is codominant. Females that receive a B and an R gene have black and orange splotches on white coats. Males can only be black or orange, but never calico.

What genotypes are expected from mating a roan bull and a roan cow? The genotype of a roan cattle is "Ww", that of red is "WW" and that of a white one is "ww". A cross between a roan bull and roan cow produces red, roan and white phenotypes in 1:2:1 ratio respectively.

What cross will produce the most pink flowered plants show Punnett square? The crossing of a red flowered plant and a white flowered plant, produces all the offspring with pink flowers. This cross illustrates. Red is dominant.

What is a complete dominance in biology? Complete dominance is a condition wherein the dominant allele completely masks the effect of the recessive allele; consequently, both alleles must be recessive for the recessive allele to be expressed.

Which statement describes the difference between incomplete dominance and codominance? The statement that describes the difference between incomplete dominance and codominance is: In codominance, both alleles are expressed in the offspring; in incomplete dominance, the offspring demonstrate an intermediate form of the alleles from the parents.

What is dominance in biology? Dominant refers to the relationship between two versions of a gene. Individuals receive two versions of each gene, known as alleles, from each parent. If the alleles of a gene are different, one allele will be expressed; it is the dominant gene. The effect of the other allele, called recessive, is masked.

How is incomplete dominance different from complete dominance? Dominance describes the effects of different gene alleles on an organism's phenotype. An allele has complete dominance over the phenotype if one copy is sufficient to produce the same effect as two. An allele with incomplete dominance, however, will combine with

the other allele to produce some intermediate phenotype.
