Starting Out with Java: Early Objects

What is an object? An object is a real-world entity that has a state and behavior. For example, a car is an object with a state (its color, make, model, etc.) and behavior (it can drive, park, etc.).

How do you create an object? You create an object by using the new keyword. For example, the following code creates a new car object:

```
Car myCar = new Car("red", "Ford", "Mustang");
```

What is a class? A class is a blueprint for creating objects. It defines the state and behavior of the objects that it creates. For example, the following class defines the state and behavior of car objects:

```
public class Car {
    private String color;
    private String make;
    private String model;

    public Car(String color, String make, String model) {
        this.color = color;
        this.make = make;
        this.model = model;
    }

    public String getColor() {
        return color;
    }
}
```

```

    }

    public void setColor(String color) {
        this.color = color;
    }

    public String getMake() {
        return make;
    }

    public void setMake(String make) {
        this.make = make;
    }

    public String getModel() {
        return model;
    }

    public void setModel(String model) {
        this.model = model;
    }

    public void drive() {
        System.out.println("The car is driving.");
    }

    public void park() {
        System.out.println("The car is parked.");
    }
}

```

How do you use an object? Once you have created an object, you can use it by calling its methods. For example, the following code calls the `drive()` method of the `myCar` object:

```
myCar.drive();
```

What are the benefits of using objects? Using objects makes your code more modular and easier to maintain. It also makes it easier to reuse code.
