Solutions to Fluid Mechanics by Roger Kinsky: Questions and Answers

1. Question: How can I determine the velocity of a fluid particle along a streamline?

Answer: Using the equation of motion for an inviscid fluid (Euler's equation), the velocity component in the direction of the streamline can be determined by integrating the pressure gradient and body forces along the streamline.

2. Question: How do I calculate the pressure distribution around an airfoil using the Bernoulli equation?

Answer: The Bernoulli equation relates the pressure, velocity, and elevation of a fluid particle. By applying the Bernoulli equation along a streamline around an airfoil, the pressure distribution can be calculated based on the known velocity field.

3. Question: How can I determine the drag force on a body submerged in a fluid?

Answer: The drag force is determined by integrating the pressure and shear stress on the body's surface. For viscous fluids, the drag force depends on the fluid viscosity, the body's shape and size, and the relative velocity between the fluid and the body.

4. Question: How do I solve the Navier-Stokes equations for viscous flows?

Answer: The Navier-Stokes equations are a set of coupled partial differential equations that describe the motion of viscous fluids. Analytical solutions for these equations are generally not available, and numerical methods such as finite difference or finite element methods are typically used.

5. Question: How can I use dimensional analysis to find scaling relationships in fluid mechanics problems?

Answer: Dimensional analysis involves identifying the relevant physical parameters and their dimensions. By grouping these parameters into dimensionless groups, scaling relationships between different variables can be established, allowing for general solutions to be applied to a range of problems with similar dimensionless groups.
