Polymerization: Addition vs. Condensation**

Introduction

Polymerization is a chemical process that involves the linking together of small molecules (monomers) to form larger molecules (polymers). There are two main types of polymerization: addition polymerization and condensation polymerization.

Addition Polymerization

Addition polymerization occurs when monomers add to each other without the elimination of small molecules. Instead, the double bonds in the monomers break and form single bonds with each other. This process is catalyzed by a free radical initiator, which starts a chain reaction that continues until all monomers have reacted.

Steps of Addition Polymerization:

1. Initiation: A free radical attacks a monomer, breaking its double bond and creating a new free radical.
2. Propagation: The new free radical reacts with another monomer, forming a larger free radical.
3. Termination: Two free radicals react with each other, breaking the chain reaction and forming the polymer.

Examples of Addition Polymerization:

- Polyethylene
- Polypropylene
- Polystyrene

Condensation Polymerization

Condensation polymerization occurs when monomers react with each other, releasing small molecules such as water or alcohol. This process is typically catalyzed by heat or acid.

Steps of Condensation Polymerization:

1. Activation: The monomers are activated by heat or acid.
2. Nucleophilic attack: A nucleophile (a species with an unshared pair of electrons) from one monomer attacks an electrophile (a species with a positive charge) on another monomer.
3. Elimination: A small molecule is eliminated as a bond forms between the two monomers.
4. Repetition: The process repeats, forming a polymer chain.

Types of Condensation Polymerization:

- **Polyamides:** Formed from amino acids
- **Polyesters:** Formed from alcohols and carboxylic acids

Comparison of Addition and Condensation Polymerization

Feature	Addition Polymerization	Condensation Polymerization
Addition of monomers	Yes	Yes
Elimination of small molecules	No	Yes
Catalyst	Free radical	Heat or acid
Example	Polyethylene	Nylon
Reaction rate	Fast	Slow
Structural regularity	High	Lower
