**How to check the strength of materials?** The basic idea of a tensile test is to place a sample of a material between two fixtures called "grips" which clamp the material. The material has known dimensions, like length and cross-sectional area. We then begin to apply weight to the material gripped at one end while the other end is fixed.

**How to test the mechanical properties of materials?** The test is performed by applying a specific load to the materials using an indenter and checking the plasticity of the material, its deformation and crack behaviour after a particular time duration called the dwell time.
