The Trojan War: A New History by Barry S. Strauss

Question 1: What is the central argument of Strauss's book?

Answer: Strauss argues that the Trojan War was not simply a mythological event, but a real historical conflict that took place in the 12th century BC. He bases this conclusion on archaeological evidence, ancient texts, and a critical analysis of the Homeric epics.

Question 2: What new insights does Strauss provide on the causes of the Trojan War?

Answer: Strauss challenges the traditional view that the war was caused solely by the abduction of Helen. He proposes that a complex web of political, economic, and cultural factors contributed to the conflict, including competition for resources, the rise of Mycenaean imperialism, and the clash between Bronze Age and Iron Age societies.

Question 3: How does Strauss depict the war's participants?

Answer: Strauss paints a vivid picture of the Mycenaean Greeks and Trojans, drawing on both archaeological and literary sources. He emphasizes the similarities between the two cultures, as well as their distinctive characteristics. He also highlights the role of women and divine intervention in shaping the course of the war.

Question 4: What are the consequences of Strauss's historical interpretation of the Trojan War?

Answer: Strauss's work challenges long-held beliefs about the war and its place in history. It suggests that the Trojan War was a more complex and nuanced event than previously understood. It also raises questions about the nature of myth and history and the boundaries between the two.

Question 5: How does Strauss's book contribute to the understanding of the ancient world?

Answer: Strauss's book provides a valuable perspective on the Bronze Age Mediterranean. It sheds light on the complexities of international relations, cultural exchange, and the role of warfare in shaping ancient history. By combining archaeological evidence with literary analysis, Strauss offers a comprehensive and engaging account of one of the most famous events in Western history.

Only after these hydrogen bonds are broken does the energy begin to increase the motion of the water molecules, which raises the temperature of the water.

What are the relative numbers of hydronium and hydroxide ions in an acid solution? And so, at this temperature, acidic solutions are those with hydronium ion molarities greater than $1.0 \times 10^{-7} \text{M}$ and hydroxide ion molarities less than $1.0 \times 10^{-7} \text{M}$ (corresponding to pH values less than 7.00 and pOH values greater than 7.00).

Why water will overflow if more water is added to a glass filled to the brim? This is because of surface tension. ... Gravity is pulling on too many of the molecules for their attraction to keep them up, and the water spills down the side of the glass.

What will happen to the level of water if you fill a glass to the brim with ice water and the ice melts? If you fill a glass completely with water and ice and the ice melts completely, the water level will remain unchanged.

Why does water form large round drops as it falls from a faucet with a slow leak? Because of a phenomenon known as surface tension, water drops, or any other liquid's drops, are spherical in shape. This acts on the surface of a freely falling drop in a liquid to reduce its area.

What is the release of latent heat from water molecules called? Condensation involves the release of latent heat. This is the 'invisible' heat which a water droplet 'stores' when it changes from a liquid into a vapor. Its subsequent change of form again releases enough latent heat to make the damp parcel of air warmer than the air surrounding it.

What must break in order for water? High Heat of Vaporization The Heat of Vaporization (H_{vap}) is the amount of energy to convert 1g of a substance from a liquid to a gas. In order for water to evaporate, hydrogen bonds must be broken. Water's heat of vaporization is 540 cal/g.

What is the relationship between pH and acidity? pHs of less than 7 indicate acidity, whereas a pH of greater than 7 indicates a base. pH is really a measure of the relative amount of free hydrogen and hydroxyl ions in the water. Water that has more free hydrogen ions is acidic, whereas water that has more free hydroxyl ions is basic.

What is the difference between pH and pOH? pH measures the concentration of hydrogen ions in a solution, while pOH measures the concentration of hydroxide ions. The pH scale ranges from 0 to 14, with values below 7 indicating an acidic solution, values of 7 being neutral, and values above 7 being basic. The pOH scale works in a similar way, but in reverse.

What is the lowest value possible on the pH scale? The scale has values ranging from zero (the most acidic) to 14 (the most basic). As you can see from the pH scale above, pure water has a pH value of 7. This value is considered neutral—neither acidic or basic.
