The Complete Idiot's Guide to Organic Chemistry: Questions and Answers

What is organic chemistry?

Organic chemistry is the study of compounds made of carbon. Carbon is a unique element in that it can form strong bonds with itself and with many other elements, creating a vast array of molecules with diverse properties. Organic molecules are

found in the building blocks of life, such as DNA, proteins, and carbohydrates. They are also found in a wide variety of materials, such as plastics, detergents, and dyes.

Why is organic chemistry important?

Organic chemistry is important because it provides the foundation for understanding the structure and function of living organisms. It also plays a key role in the development of new materials and technologies. For example, organic chemistry has been used to develop new drugs, plastics, and dyes.

What are the basic principles of organic chemistry?

The basic principles of organic chemistry include the following:

- **Atoms and molecules:** Organic compounds are made up of atoms, which are the basic building blocks of matter. Atoms join together to form molecules, which are the smallest units of a compound that have a specific composition.
- **Electronegativity:** Electronegativity is a measure of how strongly an atom attracts electrons. Carbon is an electronegative element, meaning that it has a strong attraction for electrons. This allows carbon to form strong bonds with other atoms, including hydrogen, oxygen, nitrogen, and chlorine.
- **Bonds:** Organic compounds are held together by covalent bonds, which are formed when two atoms share a pair of electrons. Covalent bonds can be single, double, or triple.
- **Functional groups:** Organic molecules are often classified by their functional groups, which are specific groups of atoms that determine the chemical properties of the molecule. Functional groups include alcohols, alkenes, aldehydes, and ketones.

What are some common organic compounds?

Some common organic compounds include the following:

- **Methane:** Methane is the simplest organic compound and is made up of one carbon atom and four hydrogen atoms.

- **Ethane:** Ethane is a hydrocarbon made up of two carbon atoms and six hydrogen atoms.
- **Benzene:** Benzene is a hydrocarbon made up of six carbon atoms and six hydrogen atoms. It is a very stable compound and is used as a solvent in many industrial processes.
- **Ethanol:** Ethanol, also known as alcohol, is an alcohol made up of two carbon atoms, six hydrogen atoms, and one oxygen atom. It is a liquid at room temperature and is used as a solvent, fuel, and beverage.
- **Glucose:** Glucose is a carbohydrate made up of six carbon atoms, twelve hydrogen atoms, and six oxygen atoms. It is the main source of energy for living organisms.
