Q&A: Solve Digital Signal Processing, 4th Edition by Proakis

Q: How do I solve Problem 2.19 from Chapter 2 of Proakis' Digital Signal Processing, 4th Edition?

A: The problem involves finding the discrete-time Fourier transform (DTFT) of a sequence $x[n] = n$. The solution uses the definition of the DTFT and the properties of the geometric series to obtain $X(\omega) = -j\omega/(1 - e^{-j\omega})$.

Q: Can you explain how to solve Problem 3.22 from Chapter 3 of Proakis' textbook?

A: The problem asks for the convolution of two sequences $x[n] = (1, 2, 3)$ and $h[n] = (4, 5, 6)$. Convolution involves element-wise multiplication and summation, resulting in $y[n] = (4, 13, 34, 51, 58, 63)$.

Q: How do I find the frequency response of a discrete-time system given its impulse response?

A: The frequency response $H(\omega)$ can be obtained by taking the DTFT of the impulse response $h[n]$. This involves using the definition of the DTFT to calculate the value of $H(\omega)$ for each frequency ω .

Q: Problem 4.12 from Chapter 4 asks for the output of a discrete-time system when the input is $x[n] = \cos(0.2\pi n)$ and the system transfer function is $H(z) = (1 - 0.5z^{-1})/(1 - 0.2z^{-1})$.

A: To solve this, we need to apply the time-domain convolution of $x[n]$ with the inverse Z-transform of $H(z)$. The result is $y[n] = (0, 0.5, 0.85, 1, 0.85, 0.5, \dots)$

Q: Can you provide a hint for solving Problem 5.18 from Chapter 5, which involves finding the frequency of a discrete-time sinusoid in the presence of noise?

A: A common technique is to use the periodogram, which estimates the power spectrum of the signal. By finding the peak in the periodogram, we can estimate the frequency of the sinusoid.
