**Why do people refuse HIV testing?** Demographic factors associated with refusal of HIV testing are older age, white race, female sex, higher income, and being married [12,13]. Common reasons for refusal are having been tested recently, feeling sick, and the perception of being at low risk for HIV infection [5,7].

**What is negative for HIV test?** If your HIV test result is negative, it doesn't necessarily mean you don't have HIV. That's because of the window period—the time between when a person gets HIV and when a test can accurately detect it. The window period varies from person to person and depends on the type of HIV test you take.

**Can HIV test kit give wrong results?** While many HIV tests are extremely accurate, they do not achieve 100% accuracy. A false negative is a test result that says a person does not have HIV when, in fact, they do. False negative results most often occur when people test in the first few weeks after infection, during the 'window period' of a test.

**How reliable are HIV home test kits?** This needs a sample of moisture from the mouth and gives results in 20 minutes.
