Sodium, Potassium, and High Blood Pressure

Q: What role do sodium and potassium play in blood pressure regulation? A:

Sodium is an electrolyte that can retain water in the body, leading to increased blood volume and pressure. Potassium, on the other hand, helps counterbalance sodium's effects by promoting water excretion and blood vessel relaxation.

Q: How does high sodium intake affect blood pressure? A:

Excessive sodium consumption can raise blood pressure by increasing the amount of water in the blood. This extra fluid volume leads to increased pressure on blood vessel walls.

Q: What is a healthy sodium intake? A:

According to the American Heart Association, adults should aim for no more than 2,300 milligrams of sodium per day. Those with high blood pressure or at risk of it should restrict their intake to 1,500 milligrams per day.

Q: How does low potassium intake affect blood pressure? A:

Inadequate potassium intake can also contribute to high blood pressure. Potassium helps regulate fluid balance and blood vessel function. When potassium levels are low, blood vessels may constrict, leading to increased blood pressure.

Q: What foods are good sources of sodium and potassium? A:

Foods high in sodium include processed meats, canned foods, and salty snacks. Good sources of

potassium include fruits, vegetables, and low-fat dairy products. By reducing sodium intake and increasing potassium intake, individuals can help lower and maintain a healthy blood pressure.
