Is the net force on a pendulum at any given moment opposite the pendulum's displacement at that moment? The net force on a pendulum at any given moment is opposite the pendulum's displacement at that moment. Resonance occurs when small forces are applied at regular intervals to an oscillating or vibrating object and the amplitude of the object's oscillation decreases.

When a wave encounters a boundary, the wave that strikes the boundary is called the incident wave.? True. T/F: When a wave encounters a boundary, the wave that strikes the boundary is called the incident wave. True.

What is the formula for the force of a pendulum? We can also write the equation of motion in terms of the displacement $s = L\theta$. The net force acting on a simple pendulum bob with mass m is $F = -mg\sin\theta$. It is a restoring force. The displacement from the equilibrium position is $s = L\theta$.

What force causes the pendulum to move? There are two dominant forces acting upon a pendulum bob at all times during the course of its motion. There is the force of gravity that acts downward upon the bob. It results from the Earth's mass attracting the mass of the bob. And there is a tension force acting upward and towards the pivot point of the pendulum.

What is the amplitude of the wave that results when two identical waves interfere constructively? Figure 13.11 The pure constructive interference of two identical waves produces a wave with twice the amplitude but the same wavelength.

When two wave pulses reach the same position on a string, the _____ add together.? Constructive interference: When two pulses meet, the heights add. If crest meets trough, the result is a smaller pulse/wave- this is called destructive interference. Notice that the interference only occurs while the two waves overlap.

When waves move around a barrier or pass through an opening it is called? Diffraction occurs when waves pass through an opening or around a barrier and change direction (Fig. 5.8). The larger the wavelength and the smaller the barrier opening, the greater the waves will appear to bend around the barrier.

Does displacement affect a pendulum? When displaced to an initial angle and released, the pendulum will swing back and forth with periodic motion. By applying Newton's second law for rotational systems, the equation of motion for the pendulum may be obtained, and rearranged as .

What is the net force on a pendulum at mean position? When the pendulum bob reaches the mean position, the net force acting on it is zero.

What happens when a pendulum is displaced? A pendulum is a body suspended from a fixed support such that it freely swings back and forth under the influence of gravity. When a pendulum is displaced sideways from its resting, equilibrium position, it is subject to a restoring force due to gravity that will accelerate it back towards the equilibrium position.

What are the forces on an inverted pendulum? As we will see below, the inverted pendulum contains two restoring forces, one positive and one negative. By adjusting the relative strengths of these two forces, we can change the oscillation frequency of the pendulum over a wide range.
