Just like automatic transmission fluid, manual transmission oil must be changed periodically to ensure that your transmission runs smoothly. Most manufacturers recommend that manual transmission oil be changed on a slightly more frequent schedule than automatic transmission fluid.

Can changing manual transmission fluid cause problems? If your fluid has never been changed before, replacing it with new fluid can cause the transmission to start slipping, even if it wasn't slipping before. This is because the old fluid will contain clutch material from being in there over time and can actually be helping the transmission to still shift gears.

What maintenance does a manual transmission need? Have your transmission inspected annually. Having a certified transmission repair specialist conduct a diagnostic check of your transmission for leaks and other abnormalities at least once a year, as well as checking the transmission fluid's level, colour, and smell periodically is smart preventative maintenance.
