Small-Scale Lab: Making a Solution Answers

Q: What is a solution? A: A solution is a homogeneous mixture of two or more components, where one component is dispersed evenly throughout the other.

Q: What are the components of a solution? A: A solution has two components: the solvent and the solute. The solvent is the component present in greater quantity and dissolves the solute. The solute is the component present in lesser quantity and is dissolved by the solvent.

Q: How do you make a solution? A: To make a solution, the solute is added to the solvent and stirred until it dissolves completely. The mass or volume of the solute and solvent used depends on the desired concentration of the solution.

Q: What are the factors that affect the rate of dissolution? A: The rate of dissolution is affected by several factors, including the temperature, surface area of the solute, agitation, and concentration of the solution.

Q: How do you determine the concentration of a solution? A: The concentration of a solution can be expressed in various units, such as molarity (M), molality (m), or mass percent (%). Molarity is calculated by dividing the moles of solute by the volume of the solution in liters. Molality is calculated by dividing the moles of solute by the mass of the solvent in kilograms. Mass percent is calculated by dividing the mass of the solute by the mass of the solution and multiplying by 100.
