Stoichiometry Lab: Vinegar and Baking Soda

Question 1: What is the mole ratio of vinegar to baking soda in this reaction?

Answer: The mole ratio is 1:1. For every mole of vinegar (CH_3COOH), 1 mole of baking soda (NaHCO_3) is required for a complete reaction.

Question 2: If 10 mL of vinegar is used, how many grams of baking soda are required? **Answer:** First, convert 10 mL of vinegar to grams using the density of

vinegar (1.00 g/mL): 10 mL $1.00 \text{ g/mL} = 10 \text{ g of vinegar}$. Then, use the mole ratio to calculate the moles of baking soda needed: 10 g vinegar (1 mol CH_3COOH / 60.05 g CH_3COOH) (1 mol NaHCO_3 / 1 mol CH_3COOH) (84.01 g NaHCO_3 / 1 mol NaHCO_3) = 1.40 g of baking soda.

Question 3: If excess vinegar is added to the reaction, how does it affect the amount of carbon dioxide gas produced? Answer: Excess vinegar will not affect the amount of carbon dioxide gas produced. The limiting reactant (baking soda) will be completely consumed, and the reaction will stop once baking soda is exhausted, regardless of the excess vinegar present.

Question 4: How can you determine if the reaction is complete using the gas collecting system? Answer: The gas collecting system can be used to monitor the production of carbon dioxide gas. If no more gas is produced over a period of time, it indicates that the reaction is complete.

Question 5: What safety precautions should be taken when conducting this experiment? Answer: Always wear gloves and protective eyewear. Handle vinegar and baking soda with care, as they can irritate skin and eyes. Do not inhale the carbon dioxide gas produced in the reaction. Dispose of the reaction products and materials properly.
